Frequently Asked Questions

What is the main difference between C3, C4, and CAM photosynthesis in Campbell Biology 12th edition?

C3 photosynthesis occurs in most plants and takes place in the chloroplasts, while C4 and CAM photosynthesis are adaptations to hot and dry environments, where C4 plants use a different anatomical structure and CAM plants open their stomata at night to reduce water loss.

According to Campbell Biology 12th edition, what are the steps of the light-independent reactions of photosynthesis?

The light-independent reactions, also known as the Calvin cycle, consist of three stages: carbon fixation, reduction, and regeneration, which convert CO₂ into glucose using ATP and NADPH produced in the light-dependent reactions.

In Campbell Biology 12th edition, what is the role of mitosis in cell division?

Mitosis is the process by which a eukaryotic cell divides into two daughter cells, each with the same number of chromosomes as the parent cell. It is essential for growth, repair, and maintenance of tissues, as well as for the development of multicellular organisms.

What is the function of the plasma membrane, according to Campbell

Biology 12th edition?

The plasma membrane, also known as the cell membrane, is a thin, semi-permeable lipid bilayer that surrounds the cell and regulates the movement of materials in and out of the cell, maintaining cellular homeostasis and controlling the exchange of nutrients, waste, and signaling molecules.

In Campbell Biology 12th edition, how does natural selection act on populations?

Natural selection acts on populations by favoring individuals with traits that enhance their survival and reproduction, leading to an increase in the frequency of those traits in the population over time, while disadvantageous traits become less common, resulting in the evolution of the population.
