

CAMPBELL BIOLOGY CHAPTER 2 STUDY GUIDE

CAMPBELL BIOLOGY CHAPTER 2 STUDY GUIDE: THE CHEMICAL FOUNDATION OF LIFE

CAMPBELL BIOLOGY CHAPTER 2 STUDY GUIDE IS AN ESSENTIAL RESOURCE FOR UNDERSTANDING THE FUNDAMENTAL CHEMICAL PRINCIPLES THAT UNDERPIN ALL BIOLOGICAL PROCESSES. THIS CHAPTER DELVES INTO THE INTRICATE WORLD OF ATOMS, MOLECULES, AND THE CHEMICAL REACTIONS THAT SUSTAIN LIFE. MASTERING THIS MATERIAL IS CRUCIAL FOR GRASPING MORE COMPLEX BIOLOGICAL CONCEPTS THROUGHOUT THE CAMPBELL BIOLOGY TEXTBOOK. WE WILL EXPLORE THE STRUCTURE OF ATOMS, THE NATURE OF CHEMICAL BONDS, THE PROPERTIES OF WATER, AND THE CARBON BACKBONE THAT FORMS THE BASIS OF ORGANIC MOLECULES. THIS COMPREHENSIVE GUIDE AIMS TO ILLUMINATE THE KEY CONCEPTS, PROVIDING A SOLID FOUNDATION FOR YOUR BIOLOGY STUDIES AND ENSURING YOU CAN CONFIDENTLY TACKLE ANY RELATED ASSESSMENTS.

TABLE OF CONTENTS

- THE CHEMICAL BUILDING BLOCKS OF LIFE
- ATOMS, ELEMENTS, AND MOLECULES
- CHEMICAL BONDING
- WATER: THE UNIVERSAL SOLVENT
- CARBON: THE BACKBONE OF ORGANIC MOLECULES
- MACROMOLECULES: THE POLYMERS OF LIFE

THE CHEMICAL BUILDING BLOCKS OF LIFE

BIOLOGY IS, AT ITS CORE, A CHEMICAL SCIENCE. UNDERSTANDING THE MOLECULAR BASIS OF LIFE REQUIRES A FIRM GRASP OF FUNDAMENTAL CHEMICAL CONCEPTS. CHAPTER 2 OF CAMPBELL BIOLOGY LAYS THIS CRUCIAL GROUNDWORK, INTRODUCING THE ESSENTIAL ELEMENTS AND COMPOUNDS THAT MAKE UP LIVING ORGANISMS AND FACILITATE THEIR FUNCTIONS. FROM THE SMALLEST ATOMS TO THE COMPLEX MACROMOLECULES, EACH COMPONENT PLAYS A VITAL ROLE IN THE INTRICATE DANCE OF LIFE.

LIFE AS WE KNOW IT DEPENDS ON A SPECIFIC SET OF CHEMICAL ELEMENTS, PRIMARILY CARBON, HYDROGEN, OXYGEN, AND NITROGEN, OFTEN REFERRED TO BY THE ACRONYM CHON. THESE ELEMENTS FORM THE BACKBONE OF ORGANIC MOLECULES, WHICH ARE THE BUILDING BLOCKS OF CELLS AND TISSUES. BEYOND THESE PRIMARY ELEMENTS, TRACE AMOUNTS OF OTHER ELEMENTS ARE ALSO INDISPENSABLE FOR VARIOUS BIOLOGICAL FUNCTIONS, ACTING AS COFACTORS, ENZYMES, OR STRUCTURAL COMPONENTS.

ATOMS, ELEMENTS, AND MOLECULES

THE SMALLEST UNIT OF MATTER THAT RETAINS THE PROPERTIES OF AN ELEMENT IS THE ATOM. ATOMS ARE COMPOSED OF

SUBATOMIC PARTICLES: PROTONS (POSITIVELY CHARGED), NEUTRONS (NEUTRAL CHARGE), AND ELECTRONS (NEGATIVELY CHARGED). THE NUMBER OF PROTONS IN AN ATOM'S NUCLEUS, KNOWN AS THE ATOMIC NUMBER, DEFINES THE ELEMENT. ELEMENTS ARE PURE SUBSTANCES THAT CANNOT BE BROKEN DOWN INTO SIMPLER SUBSTANCES BY CHEMICAL MEANS.

ATOMS CAN COMBINE TO FORM MOLECULES, WHICH ARE TWO OR MORE ATOMS HELD TOGETHER BY CHEMICAL BONDS. A MOLECULE CONSISTING OF ATOMS OF DIFFERENT ELEMENTS IS CALLED A COMPOUND. FOR INSTANCE, WATER (H_2O) IS A COMPOUND FORMED FROM HYDROGEN AND OXYGEN ATOMS. THE PROPERTIES OF A COMPOUND ARE OFTEN VERY DIFFERENT FROM THE PROPERTIES OF THE ELEMENTS THAT MAKE IT UP. UNDERSTANDING ATOMIC STRUCTURE IS FUNDAMENTAL TO COMPREHENDING HOW ATOMS INTERACT AND FORM THE DIVERSE CHEMICAL ENTITIES ESSENTIAL FOR LIFE.

ATOMIC STRUCTURE AND ISOTOPES

WITHIN AN ATOM, PROTONS AND NEUTRONS RESIDE IN THE NUCLEUS, WHILE ELECTRONS ORBIT THE NUCLEUS IN SPECIFIC ENERGY LEVELS OR SHELLS. THE ELECTRON CONFIGURATION DICTATES AN ATOM'S CHEMICAL BEHAVIOR, AS VALENCE ELECTRONS (THOSE IN THE OUTERMOST SHELL) ARE INVOLVED IN CHEMICAL BONDING. ISOTOPES ARE VARIANTS OF AN ELEMENT THAT HAVE THE SAME NUMBER OF PROTONS BUT DIFFERENT NUMBERS OF NEUTRONS. WHILE MOST ISOTOPES ARE STABLE, SOME ARE RADIOACTIVE, EMITTING PARTICLES AND ENERGY, A PROPERTY THAT HAS SIGNIFICANT APPLICATIONS IN BIOLOGY, SUCH AS IN MEDICAL IMAGING AND DATING FOSSILS.

ELEMENTS ESSENTIAL FOR LIFE

WHILE OVER 100 ELEMENTS EXIST, ONLY ABOUT 20-25 ARE CONSIDERED ESSENTIAL FOR LIFE. THESE ESSENTIAL ELEMENTS ARE CATEGORIZED INTO MAJOR ELEMENTS, TRACE ELEMENTS, AND ULTRATRACE ELEMENTS. THE MAJOR ELEMENTS, INCLUDING CARBON, HYDROGEN, OXYGEN, NITROGEN, PHOSPHORUS, AND SULFUR, MAKE UP ABOUT 96% OF THE MASS OF LIVING ORGANISMS. TRACE ELEMENTS, PRESENT IN SMALLER QUANTITIES, ARE STILL CRITICAL FOR VARIOUS PHYSIOLOGICAL PROCESSES.

CHEMICAL BONDING

CHEMICAL BONDS ARE FORCES THAT HOLD ATOMS TOGETHER IN MOLECULES AND COMPOUNDS. THE TYPE OF BOND FORMED DEPENDS ON THE DISTRIBUTION OF ELECTRONS, PARTICULARLY THE VALENCE ELECTRONS, BETWEEN ATOMS. THESE BONDS ARE THE KEY TO FORMING THE COMPLEX STRUCTURES THAT MAKE UP LIVING ORGANISMS AND DRIVE METABOLIC REACTIONS.

COVALENT BONDS

A COVALENT BOND IS FORMED WHEN TWO ATOMS SHARE ONE OR MORE PAIRS OF VALENCE ELECTRONS. THIS SHARING ALLOWS EACH ATOM TO ACHIEVE A STABLE ELECTRON CONFIGURATION. COVALENT BONDS ARE STRONG AND ARE THE PRIMARY TYPE OF BOND FOUND IN ORGANIC MOLECULES. THE NUMBER OF COVALENT BONDS AN ATOM CAN FORM IS DETERMINED BY ITS VALENCE ELECTRONS. FOR EXAMPLE, CARBON, WITH FOUR VALENCE ELECTRONS, TYPICALLY FORMS FOUR COVALENT BONDS.

IONIC BONDS

AN IONIC BOND IS FORMED BY THE TRANSFER OF ELECTRONS FROM ONE ATOM TO ANOTHER, RESULTING IN THE FORMATION OF CHARGED IONS. ONE ATOM LOSES ELECTRONS TO BECOME A POSITIVELY CHARGED CATION, WHILE ANOTHER ATOM GAINS ELECTRONS TO BECOME A NEGATIVELY CHARGED ANION. THE OPPOSITELY CHARGED IONS ARE THEN ATTRACTED TO EACH OTHER, FORMING AN IONIC BOND. WHILE WEAKER THAN COVALENT BONDS IN AQUEOUS SOLUTIONS, IONIC BONDS PLAY IMPORTANT ROLES IN BIOLOGICAL STRUCTURES AND SIGNALING.

HYDROGEN BONDS

HYDROGEN BONDS ARE A TYPE OF INTERMOLECULAR FORCE THAT FORMS BETWEEN A HYDROGEN ATOM COVALENTLY BONDED TO A HIGHLY ELECTRONEGATIVE ATOM (LIKE OXYGEN OR NITROGEN) AND ANOTHER ELECTRONEGATIVE ATOM NEARBY. ALTHOUGH INDIVIDUALLY WEAK, HYDROGEN BONDS COLLECTIVELY CONTRIBUTE SIGNIFICANTLY TO THE STRUCTURE AND PROPERTIES OF WATER AND OTHER BIOLOGICAL MOLECULES, SUCH AS DNA AND PROTEINS. THEY ARE CRUCIAL FOR HOLDING THE TWO STRANDS OF DNA TOGETHER AND DETERMINING THE THREE-DIMENSIONAL SHAPE OF PROTEINS.

WATER: THE UNIVERSAL SOLVENT

WATER (H_2O) IS ARGUABLY THE MOST IMPORTANT MOLECULE FOR LIFE ON EARTH. ITS UNIQUE CHEMICAL PROPERTIES, ARISING FROM ITS POLARITY AND ABILITY TO FORM HYDROGEN BONDS, MAKE IT AN EXCEPTIONAL SOLVENT AND A CRITICAL PARTICIPANT IN COUNTLESS BIOLOGICAL REACTIONS. LIFE, AS WE KNOW IT, COULD NOT EXIST WITHOUT WATER.

POLARITY AND HYDROGEN BONDING IN WATER

WATER IS A POLAR MOLECULE BECAUSE THE OXYGEN ATOM IS MORE ELECTRONEGATIVE THAN THE HYDROGEN ATOMS, RESULTING IN AN UNEQUAL DISTRIBUTION OF CHARGE. THE OXYGEN END OF THE MOLECULE HAS A PARTIAL NEGATIVE CHARGE, WHILE THE HYDROGEN ENDS HAVE PARTIAL POSITIVE CHARGES. THIS POLARITY ALLOWS WATER MOLECULES TO FORM HYDROGEN BONDS WITH EACH OTHER AND WITH OTHER POLAR MOLECULES, EARNING IT THE TITLE "UNIVERSAL SOLVENT" AS IT CAN DISSOLVE A WIDE RANGE OF SUBSTANCES, INCLUDING MANY IONS AND POLAR MOLECULES.

PROPERTIES OF WATER CRUCIAL FOR LIFE

WATER EXHIBITS SEVERAL EMERGENT PROPERTIES THAT ARE VITAL FOR BIOLOGICAL SYSTEMS:

- **COHESION AND ADHESION:** COHESION IS THE TENDENCY OF WATER MOLECULES TO STICK TO EACH OTHER DUE TO HYDROGEN BONDING. ADHESION IS THE ATTRACTION BETWEEN WATER MOLECULES AND OTHER POLAR SUBSTANCES. THESE PROPERTIES ARE ESSENTIAL FOR WATER TRANSPORT IN PLANTS.
- **HIGH SPECIFIC HEAT:** WATER CAN ABSORB OR RELEASE A LARGE AMOUNT OF HEAT WITH ONLY A SLIGHT CHANGE IN ITS OWN TEMPERATURE. THIS PROPERTY HELPS MODERATE TEMPERATURES IN AQUATIC ENVIRONMENTS AND WITHIN ORGANISMS, PREVENTING DRASTIC TEMPERATURE FLUCTUATIONS.
- **LOWER DENSITY AS SOLID:** UNLIKE MOST SUBSTANCES, WATER IS LESS DENSE AS A SOLID (ICE) THAN AS A LIQUID. THIS IS DUE TO THE STABLE CRYSTALLINE LATTICE FORMED BY HYDROGEN BONDS IN ICE, WHICH FORCES MOLECULES FURTHER APART. THIS PROPERTY ALLOWS ICE TO FLOAT, INSULATING BODIES OF WATER AND PROTECTING AQUATIC LIFE.
- **VERSATILITY AS A SOLVENT:** AS MENTIONED, WATER'S POLARITY MAKES IT AN EXCELLENT SOLVENT FOR POLAR AND IONIC COMPOUNDS, FACILITATING THE DISSOLUTION AND TRANSPORT OF NUTRIENTS, WASTE PRODUCTS, AND SIGNALING MOLECULES WITHIN LIVING ORGANISMS.

CARBON: THE BACKBONE OF ORGANIC MOLECULES

CARBON IS THE CENTRAL ELEMENT OF ORGANIC CHEMISTRY AND, CONSEQUENTLY, OF LIFE. ITS ABILITY TO FORM FOUR STABLE

COVALENT BONDS WITH A VARIETY OF OTHER ATOMS, INCLUDING ITSELF, ALLOWS FOR THE FORMATION OF AN IMMENSE DIVERSITY OF COMPLEX MOLECULAR STRUCTURES. THE UNIQUE VALENCY OF CARBON IS THE FOUNDATION UPON WHICH THE ENTIRE EDIFICE OF ORGANIC LIFE IS BUILT.

THE VERSATILITY OF CARBON BONDING

CARBON ATOMS CAN BOND WITH EACH OTHER TO FORM LONG CHAINS, BRANCHED CHAINS, AND RING STRUCTURES. THESE CARBON SKELETONS ARE THE FUNDAMENTAL FRAMEWORK OF ORGANIC MOLECULES. FURTHERMORE, CARBON CAN FORM SINGLE, DOUBLE, AND TRIPLE COVALENT BONDS WITH OTHER CARBON ATOMS, AND IT CAN ALSO BOND WITH HYDROGEN, OXYGEN, NITROGEN, SULFUR, AND PHOSPHORUS. THIS VERSATILITY ENABLES THE CREATION OF MOLECULES WITH VASTLY DIFFERENT SHAPES AND PROPERTIES, FROM SIMPLE SUGARS TO INTRICATE PROTEINS.

HYDROCARBONS AND FUNCTIONAL GROUPS

HYDROCARBONS ARE ORGANIC MOLECULES COMPOSED SOLELY OF CARBON AND HYDROGEN ATOMS. WHILE THEY ARE A BASIC BUILDING BLOCK, THE TRUE DIVERSITY OF ORGANIC CHEMISTRY ARISES FROM THE ADDITION OF FUNCTIONAL GROUPS. FUNCTIONAL GROUPS ARE SPECIFIC ARRANGEMENTS OF ATOMS WITHIN MOLECULES THAT ARE RESPONSIBLE FOR THE CHARACTERISTIC CHEMICAL REACTIONS OF THOSE MOLECULES. COMMON FUNCTIONAL GROUPS INCLUDE HYDROXYL ($-OH$), CARBONYL ($C=O$), CARBOXYL ($-COOH$), AMINO ($-NH_2$), AND PHOSPHATE GROUPS. THE PRESENCE AND ARRANGEMENT OF THESE GROUPS DETERMINE A MOLECULE'S PROPERTIES AND HOW IT INTERACTS WITH OTHER MOLECULES.

MACROMOLECULES: THE POLYMERS OF LIFE

LIVING ORGANISMS ARE BUILT FROM FOUR MAJOR CLASSES OF ORGANIC MACROMOLECULES: CARBOHYDRATES, LIPIDS, PROTEINS, AND NUCLEIC ACIDS. THESE LARGE MOLECULES ARE TYPICALLY POLYMERS, WHICH ARE LONG CHAINS COMPOSED OF REPEATING SMALLER UNITS CALLED MONOMERS. THE SYNTHESIS AND BREAKDOWN OF THESE MACROMOLECULES ARE FUNDAMENTAL TO ALL BIOLOGICAL PROCESSES, FROM ENERGY STORAGE AND STRUCTURAL SUPPORT TO GENETIC INFORMATION TRANSFER AND ENZYMATIC CATALYSIS.

CARBOHYDRATES

CARBOHYDRATES ARE A PRIMARY SOURCE OF ENERGY FOR CELLS AND ALSO PLAY STRUCTURAL ROLES. THEY ARE COMPOSED OF CARBON, HYDROGEN, AND OXYGEN, TYPICALLY IN A RATIO OF $(CH_2O)_n$. MONOMERS OF CARBOHYDRATES ARE MONOSACCHARIDES, SUCH AS GLUCOSE. DISACCHARIDES ARE FORMED FROM TWO MONOSACCHARIDES, AND POLYSACCHARIDES ARE LONG CHAINS OF MONOSACCHARIDES. EXAMPLES OF POLYSACCHARIDES INCLUDE STARCH (ENERGY STORAGE IN PLANTS), GLYCOGEN (ENERGY STORAGE IN ANIMALS), AND CELLULOSE (STRUCTURAL COMPONENT OF PLANT CELL WALLS).

LIPIDS

LIPIDS ARE A DIVERSE GROUP OF HYDROPHOBIC MOLECULES, MEANING THEY DO NOT MIX WELL WITH WATER. THEY INCLUDE FATS, PHOSPHOLIPIDS, AND STEROIDS. FATS, ALSO KNOWN AS TRIGLYCERIDES, ARE FORMED FROM GLYCEROL AND FATTY ACIDS AND SERVE AS A MAJOR FORM OF ENERGY STORAGE. PHOSPHOLIPIDS ARE ESSENTIAL COMPONENTS OF CELL MEMBRANES DUE TO THEIR AMPHIPATHIC NATURE (HAVING BOTH HYDROPHILIC AND HYDROPHOBIC REGIONS). STEROIDS, CHARACTERIZED BY A FOUR-RING STRUCTURE, FUNCTION AS HORMONES AND ARE ALSO COMPONENTS OF CELL MEMBRANES (E.G., CHOLESTEROL).

PROTEINS

PROTEINS ARE THE WORKHORSES OF THE CELL, PERFORMING A VAST ARRAY OF FUNCTIONS, INCLUDING ENZYMATIC CATALYSIS, STRUCTURAL SUPPORT, TRANSPORT, SIGNALING, AND DEFENSE. PROTEINS ARE POLYMERS OF AMINO ACIDS, LINKED TOGETHER BY PEPTIDE BONDS. THE SEQUENCE OF AMINO ACIDS, KNOWN AS THE PRIMARY STRUCTURE, DICTATES THE PROTEIN'S THREE-DIMENSIONAL SHAPE, WHICH IN TURN DETERMINES ITS FUNCTION. PROTEINS FOLD INTO COMPLEX SECONDARY, TERTIARY, AND SOMETIMES QUATERNARY STRUCTURES, AND THEIR FUNCTIONALITY IS HIGHLY DEPENDENT ON THIS PRECISE ARCHITECTURE.

NUCLEIC ACIDS

NUCLEIC ACIDS, DNA AND RNA, ARE RESPONSIBLE FOR STORING AND TRANSMITTING GENETIC INFORMATION. THEY ARE POLYMERS COMPOSED OF MONOMERS CALLED NUCLEOTIDES. EACH NUCLEOTIDE CONSISTS OF A NITROGENOUS BASE, A FIVE-CARBON SUGAR (DEOXYRIBOSE IN DNA, RIBOSE IN RNA), AND A PHOSPHATE GROUP. DNA TYPICALLY EXISTS AS A DOUBLE HELIX, WITH TWO POLYNUCLEOTIDE STRANDS HELD TOGETHER BY HYDROGEN BONDS BETWEEN COMPLEMENTARY BASES (ADENINE WITH THYMINE, GUANINE WITH CYTOSINE). RNA IS USUALLY SINGLE-STRANDED AND PLAYS VARIOUS ROLES IN PROTEIN SYNTHESIS.

FAQ

Q: WHAT ARE THE MOST IMPORTANT ELEMENTS DISCUSSED IN CAMPBELL BIOLOGY CHAPTER 2?

A: THE MOST IMPORTANT ELEMENTS DISCUSSED IN CAMPBELL BIOLOGY CHAPTER 2 ARE CARBON, HYDROGEN, OXYGEN, AND NITROGEN (CHON), AS THEY FORM THE FUNDAMENTAL BASIS OF ORGANIC MOLECULES ESSENTIAL FOR LIFE. OTHER ESSENTIAL ELEMENTS LIKE PHOSPHORUS AND SULFUR ARE ALSO HIGHLIGHTED FOR THEIR ROLES IN CRUCIAL BIOMOLECULES.

Q: CAN YOU EXPLAIN THE DIFFERENCE BETWEEN COVALENT AND IONIC BONDS IN A BIOLOGICAL CONTEXT?

A: COVALENT BONDS INVOLVE THE SHARING OF ELECTRONS BETWEEN ATOMS, FORMING STABLE MOLECULES LIKE WATER AND THE BACKBONE OF ORGANIC COMPOUNDS. IONIC BONDS INVOLVE THE TRANSFER OF ELECTRONS, CREATING CHARGED IONS THAT ARE ATTRACTED TO EACH OTHER, IMPORTANT FOR MOLECULES LIKE SALTS AND INVOLVED IN CELLULAR SIGNALING.

Q: WHY IS WATER CONSIDERED THE "UNIVERSAL SOLVENT" IN BIOLOGY, AND WHAT ARE ITS KEY PROPERTIES?

A: WATER IS CALLED THE UNIVERSAL SOLVENT DUE TO ITS POLARITY, WHICH ALLOWS IT TO DISSOLVE MANY POLAR AND IONIC SUBSTANCES. ITS KEY PROPERTIES CRUCIAL FOR LIFE INCLUDE COHESION, ADHESION, HIGH SPECIFIC HEAT, AND ITS LOWER DENSITY AS A SOLID, ALL OF WHICH CONTRIBUTE TO MAINTAINING STABLE ENVIRONMENTS FOR BIOLOGICAL PROCESSES.

Q: WHAT MAKES CARBON SUCH A UNIQUE AND VERSATILE ELEMENT FOR BUILDING BIOLOGICAL MOLECULES?

A: CARBON'S UNIQUE ABILITY TO FORM FOUR STABLE COVALENT BONDS WITH ITSELF AND OTHER ELEMENTS ALLOWS IT TO CREATE LONG, COMPLEX CHAINS, BRANCHED STRUCTURES, AND RINGS. THIS VERSATILITY IS THE FOUNDATION FOR THE VAST DIVERSITY OF ORGANIC MOLECULES FOUND IN LIVING ORGANISMS.

Q: WHAT ARE THE FOUR MAJOR CLASSES OF MACROMOLECULES, AND WHAT ARE THEIR BASIC BUILDING BLOCKS?

A: THE FOUR MAJOR CLASSES OF MACROMOLECULES ARE CARBOHYDRATES (MONOMERS: MONOSACCHARIDES), LIPIDS (DIVERSE, BUT OFTEN INVOLVE FATTY ACIDS AND GLYCEROL), PROTEINS (MONOMERS: AMINO ACIDS), AND NUCLEIC ACIDS (MONOMERS: NUCLEOTIDES).

Q: HOW DO FUNCTIONAL GROUPS CONTRIBUTE TO THE DIVERSITY OF ORGANIC MOLECULES?

A: FUNCTIONAL GROUPS ARE SPECIFIC ARRANGEMENTS OF ATOMS ATTACHED TO THE CARBON SKELETON OF ORGANIC MOLECULES. THEY DETERMINE THE MOLECULE'S CHEMICAL PROPERTIES AND REACTIVITY, ALLOWING FOR A WIDE RANGE OF FUNCTIONS AND INTERACTIONS WITHIN BIOLOGICAL SYSTEMS.

Q: WHAT IS THE SIGNIFICANCE OF HYDROGEN BONDING IN BIOLOGICAL SYSTEMS, PARTICULARLY CONCERNING WATER AND MACROMOLECULES?

A: HYDROGEN BONDS ARE CRUCIAL FOR THE PROPERTIES OF WATER, SUCH AS ITS HIGH BOILING POINT AND SURFACE TENSION, WHICH ARE VITAL FOR LIFE. THEY ALSO PLAY A CRITICAL ROLE IN MAINTAINING THE THREE-DIMENSIONAL STRUCTURES OF MACROMOLECULES LIKE PROTEINS AND DNA, WHICH IS ESSENTIAL FOR THEIR FUNCTION.

Q: EXPLAIN THE CONCEPT OF POLYMERS AND MONOMERS IN THE CONTEXT OF MACROMOLECULES.

A: POLYMERS ARE LARGE MOLECULES MADE UP OF REPEATING SMALLER UNITS CALLED MONOMERS. FOR EXAMPLE, PROTEINS ARE POLYMERS MADE OF AMINO ACID MONOMERS, AND DNA IS A POLYMER MADE OF NUCLEOTIDE MONOMERS. THIS MODULAR STRUCTURE ALLOWS FOR EFFICIENT SYNTHESIS AND THE CREATION OF DIVERSE LARGE MOLECULES.
