

CAUSAL INFERENCE TUTORIAL

THE PRACTICE OF DRAWING CONCLUSIONS ABOUT CAUSE-AND-EFFECT RELATIONSHIPS FROM DATA IS KNOWN AS CAUSAL INFERENCE, AND MASTERING IT IS CRUCIAL FOR INFORMED DECISION-MAKING ACROSS MANY FIELDS. THIS COMPREHENSIVE CAUSAL INFERENCE TUTORIAL WILL GUIDE YOU THROUGH THE FUNDAMENTAL CONCEPTS, METHODOLOGIES, AND PRACTICAL APPLICATIONS OF DETERMINING CAUSALITY. WE WILL EXPLORE WHY ESTABLISHING A CAUSAL LINK IS MORE CHALLENGING THAN SIMPLY OBSERVING A CORRELATION AND DELVE INTO THE CRITICAL ASSUMPTIONS AND POTENTIAL PITFALLS. FURTHERMORE, THIS GUIDE WILL INTRODUCE YOU TO VARIOUS CAUSAL INFERENCE TECHNIQUES, FROM OBSERVATIONAL STUDY DESIGNS TO EXPERIMENTAL APPROACHES, EQUIPPING YOU WITH THE KNOWLEDGE TO DESIGN AND ANALYZE STUDIES THAT CAN CREDIBLY IDENTIFY CAUSAL EFFECTS. UNDERSTANDING CAUSAL INFERENCE IS PARAMOUNT FOR FIELDS LIKE A/B TESTING, POLICY EVALUATION, MEDICAL RESEARCH, AND BUSINESS ANALYTICS, ENABLING MORE ROBUST AND ACTIONABLE INSIGHTS.

WHAT IS CAUSAL INFERENCE?

CAUSAL INFERENCE IS THE PROCESS OF DETERMINING WHETHER A SPECIFIC EVENT, ACTION, OR VARIABLE (THE "CAUSE") HAS A DIRECT IMPACT ON ANOTHER EVENT, ACTION, OR VARIABLE (THE "EFFECT"). IT GOES BEYOND MERE ASSOCIATION, WHICH SIMPLY INDICATES THAT TWO THINGS TEND TO OCCUR TOGETHER, TO ESTABLISH A DIRECTIONAL RELATIONSHIP. IN ESSENCE, CAUSAL INFERENCE SEEKS TO ANSWER THE "WHY" BEHIND OBSERVED PHENOMENA, MOVING FROM DESCRIPTIVE STATISTICS TO EXPLANATORY INSIGHTS. THIS IS A CRITICAL DISTINCTION BECAUSE CORRELATION DOES NOT IMPLY CAUSATION; TWO VARIABLES CAN BE CORRELATED DUE TO A THIRD, UNOBSERVED FACTOR (CONFOUNDING) OR BY PURE CHANCE, WITHOUT ONE DIRECTLY INFLUENCING THE OTHER.

THE ABILITY TO MAKE SOUND CAUSAL CLAIMS IS THE BEDROCK OF SCIENTIFIC INQUIRY AND EFFECTIVE DECISION-MAKING. WITHOUT IT, INTERVENTIONS AND POLICIES MIGHT BE IMPLEMENTED BASED ON FAULTY PREMISES, LEADING TO UNINTENDED CONSEQUENCES. FOR INSTANCE, OBSERVING THAT ICE CREAM SALES INCREASE WITH DROWNING INCIDENTS DOES NOT MEAN ICE CREAM CAUSES DROWNING. THE TRUE CAUSE IS LIKELY A THIRD FACTOR: WARM WEATHER. CAUSAL INFERENCE PROVIDES THE FRAMEWORK AND TOOLS TO DISENTANGLE THESE COMPLEX RELATIONSHIPS AND ISOLATE THE TRUE IMPACT OF A GIVEN FACTOR.

CAUSALITY VS. CORRELATION: A CRUCIAL DISTINCTION

ONE OF THE MOST FUNDAMENTAL CONCEPTS IN CAUSAL INFERENCE IS THE DIFFERENCE BETWEEN CORRELATION AND CAUSATION. CORRELATION DESCRIBES A STATISTICAL RELATIONSHIP WHERE TWO VARIABLES MOVE IN TANDEM. THIS MOVEMENT CAN BE POSITIVE (BOTH INCREASE OR DECREASE TOGETHER) OR NEGATIVE (ONE INCREASES AS THE OTHER DECREASES). FOR EXAMPLE, THERE'S A STRONG POSITIVE CORRELATION BETWEEN THE NUMBER OF HOURS SPENT STUDYING AND EXAM SCORES. HOWEVER, THIS CORRELATION ALONE DOESN'T DEFINITELY PROVE THAT STUDYING CAUSES HIGHER SCORES. OTHER FACTORS, SUCH AS INNATE ABILITY, QUALITY OF INSTRUCTION, OR EVEN THE STUDENT'S MOTIVATION, COULD BE INFLUENCING BOTH VARIABLES.

CAUSATION, ON THE OTHER HAND, IMPLIES THAT A CHANGE IN ONE VARIABLE DIRECTLY LEADS TO A CHANGE IN ANOTHER. TO ESTABLISH CAUSATION, WE NEED TO DEMONSTRATE THAT THE PRESUMED CAUSE PRECEDES THE PRESUMED EFFECT IN TIME AND THAT THE RELATIONSHIP IS NOT SPURIOUS, MEANING IT'S NOT EXPLAINED AWAY BY OTHER VARIABLES. THIS REQUIRES CAREFUL

STUDY DESIGN AND ANALYTICAL TECHNIQUES THAT GO BEYOND SIMPLE CORRELATION COEFFICIENTS. IGNORING THIS DISTINCTION CAN LEAD TO ERRONEOUS CONCLUSIONS AND INEFFECTIVE INTERVENTIONS.

THE FUNDAMENTAL PROBLEM OF CAUSAL INFERENCE

THE CORE CHALLENGE IN CAUSAL INFERENCE, OFTEN REFERRED TO AS THE "FUNDAMENTAL PROBLEM OF CAUSAL INFERENCE," IS THAT WE CAN NEVER OBSERVE BOTH POTENTIAL OUTCOMES FOR A SINGLE UNIT AT A SINGLE POINT IN TIME. FOR ANY INDIVIDUAL OR ENTITY, WE CAN OBSERVE WHAT HAPPENS WHEN THEY ARE EXPOSED TO A TREATMENT OR INTERVENTION (THE "TREATED" OUTCOME), BUT WE CANNOT SIMULTANEOUSLY OBSERVE WHAT WOULD HAVE HAPPENED IF THEY HAD NOT BEEN EXPOSED TO THAT SAME TREATMENT (THE "COUNTERFACTUAL" OUTCOME). THIS UNOBSERVABLE COUNTERFACTUAL IS THE CORNERSTONE OF CAUSAL ESTIMATION.

IMAGINE TRYING TO DETERMINE IF A NEW DRUG EFFECTIVELY LOWERS BLOOD PRESSURE. FOR A PATIENT RECEIVING THE DRUG, WE OBSERVE THEIR BLOOD PRESSURE. HOWEVER, WE CAN NEVER KNOW WITH CERTAINTY WHAT THEIR BLOOD PRESSURE WOULD HAVE BEEN HAD THEY NOT TAKEN THE DRUG. TO APPROXIMATE THIS COUNTERFACTUAL, RESEARCHERS EMPLOY VARIOUS STRATEGIES, SUCH AS COMPARING TREATED INDIVIDUALS TO SIMILAR UNTREATED INDIVIDUALS OR USING EXPERIMENTAL DESIGNS THAT ALLOW FOR RANDOMIZATION. THE GOAL IS TO CREATE COMPARABLE GROUPS WHERE THE ONLY SYSTEMATIC DIFFERENCE IS THE PRESENCE OR ABSENCE OF THE TREATMENT.

KEY ASSUMPTIONS IN CAUSAL INFERENCE

FOR ANY CAUSAL INFERENCE METHOD TO YIELD VALID RESULTS, SEVERAL KEY ASSUMPTIONS MUST BE MET. VIOLATIONS OF THESE ASSUMPTIONS CAN LEAD TO BIASED ESTIMATES OF CAUSAL EFFECTS. UNDERSTANDING AND ASSESSING THESE ASSUMPTIONS IS AS IMPORTANT AS APPLYING THE STATISTICAL TECHNIQUES THEMSELVES.

THE IGNORABILITY ASSUMPTION (UNCONFOUNDEDNESS)

THIS ASSUMPTION, ALSO KNOWN AS THE "NO UNMEASURED CONFOUNDERS" ASSUMPTION OR "CONDITIONAL INDEPENDENCE," STATES THAT, CONDITIONAL ON A SET OF OBSERVED COVARIATES, THE TREATMENT ASSIGNMENT IS INDEPENDENT OF THE POTENTIAL OUTCOMES. IN SIMPLER TERMS, IT MEANS THAT ALL COMMON CAUSES OF THE TREATMENT AND THE OUTCOME HAVE BEEN MEASURED AND CONTROLLED FOR IN THE ANALYSIS. IF THERE ARE UNMEASURED VARIABLES THAT INFLUENCE BOTH WHO RECEIVES THE TREATMENT AND THE OUTCOME, THE RESULTING CAUSAL ESTIMATES WILL BE BIASED.

THE POSITIVITY ASSUMPTION (COMMON SUPPORT)

THE POSITIVITY ASSUMPTION, ALSO CALLED "COMMON SUPPORT," REQUIRES THAT FOR ANY COMBINATION OF THE OBSERVED COVARIATES, THERE IS A NON-ZERO PROBABILITY OF RECEIVING EITHER TREATMENT OR CONTROL. THIS MEANS THAT EVERY INDIVIDUAL IN THE STUDY POPULATION MUST HAVE A CHANCE OF BEING ASSIGNED TO ANY OF THE TREATMENT GROUPS. IF CERTAIN GROUPS OF INDIVIDUALS ARE SYSTEMATICALLY EXCLUDED FROM TREATMENT OR CONTROL, IT BECOMES IMPOSSIBLE TO ESTIMATE THE CAUSAL EFFECT FOR THOSE GROUPS, AS WE HAVE NO OBSERVED DATA FOR THEIR COUNTERFACTUALS.

THE CONSISTENCY ASSUMPTION

THE CONSISTENCY ASSUMPTION LINKS THE OBSERVED OUTCOME FOR A UNIT UNDER ITS ACTUAL TREATMENT STATUS TO ITS POTENTIAL OUTCOME UNDER THAT SAME TREATMENT STATUS. IT IMPLIES THAT THE OBSERVED OUTCOME FOR A TREATED

INDIVIDUAL IS THE OUTCOME THEY WOULD HAVE EXPERIENCED HAD THEY RECEIVED THE TREATMENT, AND SIMILARLY FOR THE CONTROL GROUP. THIS MEANS THERE SHOULD BE NO OTHER UNOBSERVED FACTORS THAT DIFFER BETWEEN THE TREATED AND CONTROL GROUPS BESIDES THE TREATMENT ITSELF, WHICH COULD ALSO AFFECT THE OUTCOME. IN ESSENCE, THE TREATMENT IS WELL-DEFINED AND APPLIED CONSISTENTLY.

COMMON CAUSAL INFERENCE METHODS

NUMEROUS METHODS HAVE BEEN DEVELOPED TO ESTIMATE CAUSAL EFFECTS FROM DATA, EACH WITH ITS STRENGTHS, WEAKNESSES, AND UNDERLYING ASSUMPTIONS. THE CHOICE OF METHOD OFTEN DEPENDS ON THE NATURE OF THE DATA, THE RESEARCH QUESTION, AND THE FEASIBILITY OF DIFFERENT STUDY DESIGNS.

RANDOMIZED CONTROLLED TRIALS (RCTs)

RANDOMIZED CONTROLLED TRIALS ARE CONSIDERED THE GOLD STANDARD FOR ESTABLISHING CAUSALITY. IN AN RCT, PARTICIPANTS ARE RANDOMLY ASSIGNED TO EITHER A TREATMENT GROUP OR A CONTROL GROUP. RANDOMIZATION ENSURES THAT, ON AVERAGE, THE GROUPS ARE SIMILAR IN ALL RESPECTS, BOTH MEASURED AND UNMEASURED, BEFORE THE INTERVENTION BEGINS. THEREFORE, ANY OBSERVED DIFFERENCE IN OUTCOMES BETWEEN THE GROUPS CAN BE ATTRIBUTED TO THE TREATMENT WITH A HIGH DEGREE OF CONFIDENCE. RCTs ARE CRUCIAL IN MEDICINE, PSYCHOLOGY, AND PROGRAM EVALUATION.

OBSERVATIONAL STUDY DESIGNS

WHEN RCTs ARE NOT FEASIBLE, ETHICAL, OR PRACTICAL, RESEARCHERS TURN TO OBSERVATIONAL STUDIES. THESE STUDIES ANALYZE DATA THAT HAS ALREADY BEEN COLLECTED WITHOUT THE RESEARCHER INTERVENING IN THE TREATMENT ASSIGNMENT. WHILE POWERFUL, OBSERVATIONAL STUDIES ARE MORE SUSCEPTIBLE TO CONFOUNDING BIAS, REQUIRING SOPHISTICATED METHODS TO CONTROL FOR IT.

MATCHING

MATCHING INVOLVES PAIRING INDIVIDUALS IN THE TREATMENT GROUP WITH SIMILAR INDIVIDUALS IN THE CONTROL GROUP BASED ON OBSERVABLE COVARIATES. THE GOAL IS TO CREATE GROUPS THAT ARE AS BALANCED AS POSSIBLE ON THESE CONFOUNDERS. COMMON MATCHING TECHNIQUES INCLUDE EXACT MATCHING, PROPENSITY SCORE MATCHING, AND COARSENEDED EXACT MATCHING.

STRATIFICATION

STRATIFICATION DIVIDES THE DATA INTO SUBGROUPS (STRATA) BASED ON THE VALUES OF CONFOUNDING VARIABLES. WITHIN EACH STRATUM, THE TREATMENT AND CONTROL GROUPS ARE ASSUMED TO BE MORE COMPARABLE. THE CAUSAL EFFECT IS THEN ESTIMATED WITHIN EACH STRATUM, AND THESE ESTIMATES ARE AVERAGED TO OBTAIN AN OVERALL EFFECT.

REGRESSION ADJUSTMENT

REGRESSION MODELS CAN BE USED TO ESTIMATE THE RELATIONSHIP BETWEEN THE TREATMENT, COVARIATES, AND THE OUTCOME. BY INCLUDING COVARIATES IN THE REGRESSION EQUATION, WE CAN STATISTICALLY "ADJUST" FOR THEIR EFFECTS, ISOLATING THE ESTIMATED IMPACT OF THE TREATMENT. THIS METHOD RELIES HEAVILY ON THE CORRECT SPECIFICATION OF THE REGRESSION MODEL AND THE ASSUMPTION OF NO UNMEASURED CONFOUNDERS.

INSTRUMENTAL VARIABLES (IV)

INSTRUMENTAL VARIABLES ARE USED WHEN THERE IS CONCERN ABOUT UNMEASURED CONFOUNDING. AN INSTRUMENTAL VARIABLE IS A VARIABLE THAT AFFECTS THE TREATMENT ASSIGNMENT BUT DOES NOT DIRECTLY AFFECT THE OUTCOME, EXCEPT THROUGH ITS EFFECT ON THE TREATMENT. IT ACTS AS A SOURCE OF RANDOM VARIATION IN TREATMENT THAT IS UNRELATED TO UNMEASURED CONFOUNDERS, ALLOWING FOR CAUSAL ESTIMATION.

DIFFERENCE-IN-DIFFERENCES (DiD)

THE DIFFERENCE-IN-DIFFERENCES METHOD IS USED TO ESTIMATE THE CAUSAL EFFECT OF AN INTERVENTION BY COMPARING THE CHANGE IN OUTCOMES OVER TIME FOR A TREATED GROUP WITH THE CHANGE IN OUTCOMES OVER TIME FOR A CONTROL GROUP. IT RELIES ON THE ASSUMPTION THAT, IN THE ABSENCE OF THE INTERVENTION, THE TRENDS IN OUTCOMES FOR BOTH GROUPS WOULD HAVE BEEN PARALLEL.

REGRESSION DISCONTINUITY DESIGN (RDD)

REGRESSION DISCONTINUITY DESIGN IS A QUASI-EXPERIMENTAL METHOD USED WHEN TREATMENT IS ASSIGNED BASED ON A CONTINUOUS VARIABLE CROSSING A SPECIFIC THRESHOLD. FOR EXAMPLE, IF A SCHOLARSHIP IS AWARDED TO STUDENTS SCORING ABOVE A CERTAIN EXAM SCORE. RDD COMPARES INDIVIDUALS JUST ABOVE AND JUST BELOW THE CUTOFF, ASSUMING THEY ARE OTHERWISE SIMILAR, TO ESTIMATE THE CAUSAL EFFECT OF THE SCHOLARSHIP.

DESIGNING CAUSAL STUDIES

THE DESIGN OF A STUDY IS PARAMOUNT FOR ITS ABILITY TO YIELD CREDIBLE CAUSAL INFERENCES. A WELL-DESIGNED STUDY ANTICIPATES POTENTIAL BIASES AND INCORPORATES MECHANISMS TO MITIGATE THEM.

DEFINING THE CAUSAL QUESTION CLEARLY

BEFORE EMBARKING ON ANY STUDY, IT IS CRUCIAL TO ARTICULATE THE PRECISE CAUSAL QUESTION. WHAT IS THE SPECIFIC TREATMENT OR INTERVENTION? WHAT IS THE OUTCOME OF INTEREST? WHAT IS THE TARGET POPULATION? A CLEARLY DEFINED CAUSAL QUESTION GUIDES THE ENTIRE RESEARCH PROCESS, FROM DATA COLLECTION TO ANALYSIS.

IDENTIFYING POTENTIAL CONFOUNDERS

A CRITICAL STEP IN DESIGNING A CAUSAL STUDY IS TO IDENTIFY ALL PLAUSIBLE CONFOUNDING VARIABLES. THESE ARE VARIABLES THAT ARE ASSOCIATED WITH BOTH THE EXPOSURE (TREATMENT) AND THE OUTCOME AND, IF NOT ACCOUNTED FOR, CAN DISTORT THE ESTIMATED CAUSAL EFFECT. DOMAIN EXPERTISE IS INVALUABLE IN THIS PROCESS.

CHOOSING THE RIGHT STUDY DESIGN

THE SELECTION OF THE STUDY DESIGN SHOULD ALIGN WITH THE CAUSAL QUESTION AND THE AVAILABLE RESOURCES. FOR INSTANCE, IF POLICY CHANGES ARE BEING EVALUATED, A DIFFERENCE-IN-DIFFERENCES APPROACH MIGHT BE SUITABLE. IF A NEW MARKETING CAMPAIGN'S IMPACT IS TO BE MEASURED, AN A/B TEST (A TYPE OF RCT) WOULD BE IDEAL.

EVALUATING CAUSAL MODELS

ONCE A CAUSAL INFERENCE METHOD HAS BEEN APPLIED, IT IS ESSENTIAL TO RIGOROUSLY EVALUATE THE RESULTING MODEL AND ITS ESTIMATES. THIS INVOLVES ASSESSING WHETHER THE UNDERLYING ASSUMPTIONS ARE PLAUSIBLE AND HOW SENSITIVE THE RESULTS ARE TO POTENTIAL VIOLATIONS.

SENSITIVITY ANALYSIS

SENSITIVITY ANALYSIS IS A CRUCIAL STEP TO UNDERSTAND HOW ROBUST THE ESTIMATED CAUSAL EFFECT IS TO POTENTIAL UNMEASURED CONFOUNDERS. IT INVOLVES ASSESSING HOW STRONG AN UNMEASURED CONFOUNDER WOULD NEED TO BE TO OVERTURN THE STUDY'S CONCLUSIONS. IF A SUBSTANTIAL UNMEASURED CONFOUNDER IS REQUIRED, THE RESULTS ARE CONSIDERED MORE ROBUST.

MODEL DIAGNOSTICS

FOR METHODS INVOLVING STATISTICAL MODELS, SUCH AS REGRESSION OR PROPENSITY SCORE ANALYSIS, DIAGNOSTIC CHECKS ARE NECESSARY. THESE CAN INCLUDE EXAMINING RESIDUALS, ASSESSING MODEL FIT, AND ENSURING THAT ASSUMPTIONS LIKE LINEARITY AND HOMOSCEDASTICITY ARE REASONABLY MET. FOR PROPENSITY SCORE METHODS, BALANCE CHECKS ARE VITAL TO CONFIRM THAT THE COVARIATES ARE WELL-BALANCED BETWEEN TREATED AND CONTROL GROUPS AFTER MATCHING OR WEIGHTING.

APPLICATIONS OF CAUSAL INFERENCE

THE PRINCIPLES AND METHODS OF CAUSAL INFERENCE HAVE BROAD APPLICATIONS ACROSS NUMEROUS DISCIPLINES, DRIVING EVIDENCE-BASED DECISION-MAKING AND ADVANCING UNDERSTANDING.

- **MARKETING AND ADVERTISING:** DETERMINING THE TRUE ROI OF MARKETING CAMPAIGNS, UNDERSTANDING CUSTOMER BEHAVIOR, AND OPTIMIZING PRICING STRATEGIES.
- **PUBLIC HEALTH AND MEDICINE:** EVALUATING THE EFFECTIVENESS OF TREATMENTS, UNDERSTANDING DISEASE RISK FACTORS, AND ASSESSING THE IMPACT OF PUBLIC HEALTH INTERVENTIONS.
- **ECONOMICS AND POLICY EVALUATION:** MEASURING THE IMPACT OF GOVERNMENT POLICIES, UNDERSTANDING LABOR MARKET DYNAMICS, AND ASSESSING THE EFFECTIVENESS OF SOCIAL PROGRAMS.
- **SOCIAL SCIENCES:** STUDYING THE EFFECTS OF EDUCATION, CRIME, AND SOCIAL INTERVENTIONS ON INDIVIDUAL AND SOCIETAL OUTCOMES.
- **TECHNOLOGY AND A/B TESTING:** OPTIMIZING USER INTERFACES, UNDERSTANDING THE IMPACT OF NEW FEATURES, AND PERSONALIZING USER EXPERIENCES.

CHALLENGES AND LIMITATIONS IN CAUSAL INFERENCE

DESPITE THE POWERFUL TOOLS AVAILABLE, CAUSAL INFERENCE IS NOT WITHOUT ITS CHALLENGES AND LIMITATIONS.

AWARENESS OF THESE CAN LEAD TO MORE CAUTIOUS AND ACCURATE INTERPRETATIONS OF FINDINGS.

ONE SIGNIFICANT CHALLENGE IS THE PERVASIVE ISSUE OF UNMEASURED CONFOUNDING. EVEN WITH METICULOUS DATA COLLECTION, IT'S OFTEN IMPOSSIBLE TO MEASURE EVERY FACTOR THAT COULD INFLUENCE BOTH TREATMENT AND OUTCOME. THIS MEANS THAT OBSERVATIONAL STUDIES MAY NEVER FULLY ELIMINATE THE RISK OF BIAS, REQUIRING CAREFUL INTERPRETATION AND OFTEN A RELIANCE ON SENSITIVITY ANALYSES.

ANOTHER LIMITATION IS THE GENERALIZABILITY OF FINDINGS. CAUSAL EFFECTS ESTIMATED IN ONE POPULATION OR CONTEXT MAY NOT APPLY TO OTHERS. THIS IS PARTICULARLY TRUE WHEN STUDYING INTERVENTIONS THAT ARE HIGHLY DEPENDENT ON SPECIFIC CULTURAL, ENVIRONMENTAL, OR INSTITUTIONAL FACTORS. RESEARCHERS MUST CAREFULLY CONSIDER THE EXTERNAL VALIDITY OF THEIR CAUSAL CLAIMS.

FURTHERMORE, ETHICAL CONSIDERATIONS CAN LIMIT THE TYPES OF CAUSAL QUESTIONS THAT CAN BE INVESTIGATED. FOR INSTANCE, IT MAY BE UNETHICAL TO DELIBERATELY EXPOSE INDIVIDUALS TO HARMFUL SUBSTANCES OR TO WITHHOLD POTENTIALLY LIFE-SAVING TREATMENTS, NECESSITATING THE USE OF QUASI-EXPERIMENTAL METHODS OR OBSERVATIONAL DATA.

FINALLY, THE COMPLEXITY OF THE METHODS THEMSELVES CAN BE A BARRIER. UNDERSTANDING THE NUANCES OF DIFFERENT CAUSAL INFERENCE TECHNIQUES, THEIR ASSUMPTIONS, AND THEIR LIMITATIONS REQUIRES SIGNIFICANT STATISTICAL AND DOMAIN KNOWLEDGE. MISAPPLICATION OF THESE METHODS CAN LEAD TO ERRONEOUS CAUSAL CONCLUSIONS.

FAQ SECTION

Q: WHAT IS THE MAIN DIFFERENCE BETWEEN CORRELATION AND CAUSATION IN THE CONTEXT OF A CAUSAL INFERENCE TUTORIAL?

A: CORRELATION SIMPLY MEANS TWO VARIABLES TEND TO MOVE TOGETHER, WHILE CAUSATION IMPLIES THAT A CHANGE IN ONE VARIABLE DIRECTLY LEADS TO A CHANGE IN THE OTHER. A CAUSAL INFERENCE TUTORIAL EMPHASIZES THE METHODS AND ASSUMPTIONS NEEDED TO MOVE BEYOND OBSERVED ASSOCIATIONS TO ESTABLISH A GENUINE CAUSE-AND-EFFECT RELATIONSHIP.

Q: WHY IS THE COUNTERFACTUAL OUTCOME SO IMPORTANT IN CAUSAL INFERENCE?

A: THE COUNTERFACTUAL OUTCOME IS WHAT WOULD HAVE HAPPENED IF THE TREATMENT OR INTERVENTION HAD NOT OCCURRED FOR A SPECIFIC UNIT. SINCE WE CAN NEVER OBSERVE THIS DIRECTLY FOR THE SAME UNIT AT THE SAME TIME AS THE ACTUAL OUTCOME, ESTIMATING OR APPROXIMATING THIS COUNTERFACTUAL IS THE CENTRAL CHALLENGE AND GOAL OF CAUSAL INFERENCE.

Q: WHAT ARE THE MOST CRITICAL ASSUMPTIONS FOR A CAUSAL INFERENCE TUTORIAL TO COVER WHEN DISCUSSING OBSERVATIONAL STUDIES?

A: THE MOST CRITICAL ASSUMPTIONS TO COVER ARE IGNORABILITY (NO UNMEASURED CONFOUNDERS), POSITIVITY (COMMON SUPPORT), AND CONSISTENCY (THE TREATMENT IS WELL-DEFINED AND THE OBSERVED OUTCOME REFLECTS THE POTENTIAL OUTCOME). VIOLATIONS OF THESE ASSUMPTIONS CAN LEAD TO BIASED CAUSAL ESTIMATES.

Q: CAN A RANDOMIZED CONTROLLED TRIAL (RCT) EVER BE BIASED IN CAUSAL INFERENCE?

A: WHILE RCTs ARE CONSIDERED THE GOLD STANDARD AND MINIMIZE BIAS DUE TO MEASURED AND UNMEASURED CONFOUNDERS THROUGH RANDOMIZATION, THEY CAN STILL SUFFER FROM BIASES IF NOT PROPERLY CONDUCTED. THESE CAN INCLUDE ATTRITION BIAS (DIFFERENTIAL DROPOUT BETWEEN GROUPS), SELECTION BIAS IN RECRUITMENT, OR DEVIATIONS FROM THE INTENDED TREATMENT PROTOCOL.

Q: WHAT IS PROPENSITY SCORE MATCHING, AND HOW DOES IT HELP IN CAUSAL INFERENCE?

A: PROPENSITY SCORE MATCHING IS A TECHNIQUE USED IN OBSERVATIONAL STUDIES TO REDUCE CONFOUNDING BIAS. IT INVOLVES CALCULATING A SCORE FOR EACH INDIVIDUAL THAT REPRESENTS THE PROBABILITY OF RECEIVING THE TREATMENT GIVEN THEIR OBSERVED COVARIATES. INDIVIDUALS ARE THEN MATCHED BASED ON THESE SCORES TO CREATE COMPARABLE TREATMENT AND CONTROL GROUPS, AIMING TO MIMIC THE BALANCE ACHIEVED IN AN RCT.

Q: WHEN WOULD A DIFFERENCE-IN-DIFFERENCES (DID) APPROACH BE MOST APPROPRIATE IN A CAUSAL INFERENCE TUTORIAL?

A: A DIFFERENCE-IN-DIFFERENCES APPROACH IS MOST APPROPRIATE FOR ESTIMATING THE CAUSAL EFFECT OF AN INTERVENTION OR POLICY WHEN YOU HAVE PANEL DATA (DATA COLLECTED OVER TIME FOR THE SAME UNITS) FOR BOTH A TREATED GROUP AND A CONTROL GROUP. IT COMPARES THE CHANGE IN OUTCOMES OVER TIME FOR THE TREATED GROUP TO THE CHANGE IN OUTCOMES OVER TIME FOR THE CONTROL GROUP, ASSUMING PARALLEL TRENDS IN THE ABSENCE OF THE INTERVENTION.

Q: WHAT IS INSTRUMENTAL VARIABLE (IV) ANALYSIS IN CAUSAL INFERENCE, AND WHEN IS IT USED?

A: INSTRUMENTAL VARIABLE ANALYSIS IS USED WHEN THERE IS SUSPICION OF UNMEASURED CONFOUNDING. AN INSTRUMENTAL VARIABLE IS A VARIABLE THAT INFLUENCES THE TREATMENT ASSIGNMENT BUT DOES NOT DIRECTLY AFFECT THE OUTCOME, EXCEPT INDIRECTLY THROUGH THE TREATMENT. IT HELPS TO ISOLATE THE CAUSAL EFFECT OF THE TREATMENT BY LEVERAGING THE VARIATION INDUCED BY THE INSTRUMENT THAT IS EXOGENOUS TO UNMEASURED CONFOUNDERS.

Q: HOW IMPORTANT IS SENSITIVITY ANALYSIS IN A CAUSAL INFERENCE TUTORIAL?

A: SENSITIVITY ANALYSIS IS EXTREMELY IMPORTANT. IT HELPS RESEARCHERS UNDERSTAND HOW ROBUST THEIR CAUSAL FINDINGS ARE TO POTENTIAL UNMEASURED CONFOUNDERS. BY QUANTIFYING HOW STRONG AN UNMEASURED CONFOUNDER WOULD NEED TO BE TO CHANGE THE STUDY'S CONCLUSION, IT PROVIDES CRUCIAL CONTEXT FOR INTERPRETING THE RESULTS, ESPECIALLY FROM OBSERVATIONAL STUDIES.
