

CHEMISTRY IN SIMPLE TERMS EXPLAINED

CHEMISTRY IN SIMPLE TERMS EXPLAINED: UNRAVELING THE BUILDING BLOCKS OF EVERYTHING

CHEMISTRY IN SIMPLE TERMS EXPLAINED SERVES AS OUR GATEWAY TO UNDERSTANDING THE FUNDAMENTAL SCIENCE THAT GOVERNS THE WORLD AROUND US, FROM THE AIR WE BREATHE TO THE FOOD WE EAT AND THE DEVICES WE USE. THIS COMPREHENSIVE ARTICLE AIMS TO DEMYSTIFY CHEMISTRY, BREAKING DOWN COMPLEX CONCEPTS INTO EASILY DIGESTIBLE EXPLANATIONS. WE WILL EXPLORE THE CORE PRINCIPLES OF MATTER, ITS PROPERTIES, AND HOW IT TRANSFORMS THROUGH CHEMICAL REACTIONS. FROM THE BASIC STRUCTURE OF ATOMS AND MOLECULES TO THE FASCINATING WORLD OF CHEMICAL BONDS AND THE ESSENTIAL ROLE OF THE PERIODIC TABLE, THIS GUIDE WILL EQUIP YOU WITH A SOLID FOUNDATION IN CHEMICAL SCIENCE. WE WILL ALSO DELVE INTO COMMON CHEMICAL PROCESSES AND THEIR EVERYDAY APPLICATIONS, ILLUSTRATING HOW CHEMISTRY IS NOT JUST AN ACADEMIC SUBJECT BUT A VITAL PART OF OUR DAILY LIVES.

EVERYDAY CHEMISTRY IN ACTION

WHAT IS CHEMISTRY?

CHEMISTRY IS THE SCIENTIFIC DISCIPLINE THAT EXPLORES THE COMPOSITION, STRUCTURE, PROPERTIES, AND REACTIONS OF MATTER. IN ESSENCE, IT'S THE STUDY OF WHAT THINGS ARE MADE OF, HOW THEY ARE PUT TOGETHER, WHAT THEY ARE LIKE, AND HOW THEY CHANGE. FROM THE VASTNESS OF THE COSMOS TO THE MICROSCOPIC WORLD WITHIN OUR OWN CELLS, CHEMISTRY PROVIDES THE FRAMEWORK FOR UNDERSTANDING THESE PHENOMENA. IT IS A FOUNDATIONAL SCIENCE THAT UNDERPINS MANY OTHER DISCIPLINES, INCLUDING BIOLOGY, PHYSICS, GEOLOGY, AND ENVIRONMENTAL SCIENCE, MAKING IT INDISPENSABLE FOR COMPREHENDING THE NATURAL WORLD.

AT ITS HEART, CHEMISTRY SEEKS TO ANSWER FUNDAMENTAL QUESTIONS ABOUT THE UNIVERSE. WHY DOES WATER FREEZE? HOW DOES A PLANT GROW? WHAT MAKES A FIRE BURN? THE ANSWERS TO THESE AND COUNTLESS OTHER QUESTIONS LIE WITHIN THE REALM OF CHEMISTRY. BY STUDYING THE INTERACTIONS BETWEEN DIFFERENT SUBSTANCES AND THE ENERGY CHANGES THAT ACCOMPANY THESE INTERACTIONS, CHEMISTS CAN PREDICT, EXPLAIN, AND EVEN CONTROL HOW MATTER BEHAVES. THIS DEEP UNDERSTANDING ALLOWS FOR INNOVATION IN FIELDS RANGING FROM MEDICINE AND AGRICULTURE TO MATERIALS SCIENCE AND ENERGY PRODUCTION.

THE FUNDAMENTAL BUILDING BLOCKS: ATOMS

THE SMALLEST, MOST BASIC UNIT OF ANY ELEMENT IS AN ATOM. ATOMS ARE INCREDIBLY TINY PARTICLES THAT MAKE UP ALL MATTER. THEY ARE SO SMALL THAT BILLIONS OF THEM COULD FIT ON THE TIP OF A PIN. DESPITE THEIR MINUSCULE SIZE, ATOMS POSSESS A SPECIFIC STRUCTURE THAT DICTATES THEIR PROPERTIES AND HOW THEY INTERACT WITH OTHER ATOMS. UNDERSTANDING ATOMS IS THE FIRST CRUCIAL STEP IN GRASPING THE CONCEPTS OF CHEMISTRY.

PROTONS, NEUTRONS, AND ELECTRONS

WITHIN EVERY ATOM, THERE ARE THREE PRIMARY SUBATOMIC PARTICLES: PROTONS, NEUTRONS, AND ELECTRONS. PROTONS AND NEUTRONS RESIDE IN THE ATOM'S CENTRAL CORE, KNOWN AS THE NUCLEUS. PROTONS CARRY A POSITIVE ELECTRICAL CHARGE, WHILE NEUTRONS HAVE NO ELECTRICAL CHARGE; THEY ARE NEUTRAL. ELECTRONS, ON THE OTHER HAND, ORBIT THE NUCLEUS IN SPECIFIC ENERGY LEVELS OR SHELLS AND CARRY A NEGATIVE ELECTRICAL CHARGE. THE NUMBER OF PROTONS IN AN ATOM'S NUCLEUS IS WHAT DEFINES THE ELEMENT IT IS.

THE BALANCE BETWEEN POSITIVELY CHARGED PROTONS AND NEGATIVELY CHARGED ELECTRONS IS CRITICAL. IN A NEUTRAL ATOM, THE NUMBER OF PROTONS EQUALS THE NUMBER OF ELECTRONS, RESULTING IN NO NET ELECTRICAL CHARGE. HOWEVER, ATOMS CAN GAIN OR LOSE ELECTRONS, BECOMING ELECTRICALLY CHARGED PARTICLES CALLED IONS, WHICH PLAY A SIGNIFICANT ROLE IN CHEMICAL BONDING AND REACTIONS.

ATOMIC NUMBER AND ATOMIC MASS

THE ATOMIC NUMBER OF AN ELEMENT IS DETERMINED BY THE NUMBER OF PROTONS IN THE NUCLEUS OF ITS ATOMS. FOR INSTANCE, EVERY ATOM WITH ONE PROTON IS HYDROGEN, AND EVERY ATOM WITH SIX PROTONS IS CARBON. THIS NUMBER IS UNIQUE TO EACH ELEMENT AND IS A FUNDAMENTAL CHARACTERISTIC. THE ATOMIC MASS, CONVERSELY, IS PRIMARILY DETERMINED BY THE NUMBER OF PROTONS AND NEUTRONS IN THE NUCLEUS, AS ELECTRONS CONTRIBUTE VERY LITTLE TO THE OVERALL MASS OF AN ATOM. THIS MASS VALUE IS OFTEN EXPRESSED IN ATOMIC MASS UNITS (AMU).

ISOTOPES ARE VARIATIONS OF AN ELEMENT THAT HAVE THE SAME NUMBER OF PROTONS BUT DIFFERENT NUMBERS OF NEUTRONS. THIS MEANS THEY HAVE THE SAME ATOMIC NUMBER BUT DIFFERENT ATOMIC MASSES. FOR EXAMPLE, CARBON-12, CARBON-13, AND CARBON-14 ARE ALL ISOTOPES OF CARBON, WITH CARBON-12 BEING THE MOST COMMON. THESE DIFFERENCES IN NEUTRON COUNT CAN HAVE IMPLICATIONS FOR RADIOACTIVE DECAY AND OTHER NUCLEAR PROCESSES.

ELEMENTS: THE PERIODIC TABLE'S STARS

ELEMENTS ARE PURE SUBSTANCES THAT CONSIST ONLY OF ATOMS THAT ALL HAVE THE SAME NUMBER OF PROTONS IN THEIR ATOMIC NUCLEI. THEY ARE THE FUNDAMENTAL BUILDING BLOCKS OF ALL CHEMICAL COMPOUNDS. CURRENTLY, 118 ELEMENTS ARE KNOWN, WITH 94 OCCURRING NATURALLY ON EARTH AND THE REST SYNTHESIZED IN LABORATORIES. THE PERIODIC TABLE IS A SYSTEMATIC ARRANGEMENT OF THESE ELEMENTS, ORGANIZED TO DISPLAY RECURRING TRENDS IN THEIR CHEMICAL PROPERTIES.

UNDERSTANDING CHEMICAL SYMBOLS

EACH ELEMENT IS REPRESENTED BY A UNIQUE ONE- OR TWO-LETTER CHEMICAL SYMBOL. THESE SYMBOLS ARE OFTEN DERIVED FROM THE ELEMENT'S NAME IN ENGLISH OR LATIN. FOR EXAMPLE, H STANDS FOR HYDROGEN, O FOR OXYGEN, Fe FOR IRON (FROM THE LATIN WORD FERRUM), AND Na FOR SODIUM (FROM THE LATIN WORD NATRIUM). THESE SYMBOLS ARE UNIVERSALLY RECOGNIZED AND USED IN CHEMICAL FORMULAS AND EQUATIONS TO REPRESENT SPECIFIC ELEMENTS.

PERIODS AND GROUPS

THE PERIODIC TABLE IS ORGANIZED INTO ROWS CALLED PERIODS AND COLUMNS CALLED GROUPS. ELEMENTS IN THE SAME PERIOD HAVE THE SAME NUMBER OF ELECTRON SHELLS. ELEMENTS IN THE SAME GROUP, ALSO KNOWN AS A FAMILY, SHARE SIMILAR CHEMICAL PROPERTIES BECAUSE THEY HAVE THE SAME NUMBER OF VALENCE ELECTRONS (ELECTRONS IN THE OUTERMOST SHELL). FOR EXAMPLE, THE ALKALI METALS IN GROUP 1 ALL REACT VIGOROUSLY WITH WATER.

- PERIOD 1: HYDROGEN (H) AND HELIUM (He)
- GROUP 1: ALKALI METALS (E.G., LITHIUM (Li), SODIUM (Na), POTASSIUM (K))
- GROUP 17: HALOGENS (E.G., FLUORINE (F), CHLORINE (Cl), BROMINE (Br))
- GROUP 18: NOBLE GASES (E.G., NEON (Ne), ARGON (Ar), KRYPTON (Kr))

MOLECULES: WHEN ATOMS UNITE

WHEN TWO OR MORE ATOMS BOND TOGETHER, THEY FORM A MOLECULE. MOLECULES ARE THE SMALLEST UNIT OF A CHEMICAL COMPOUND THAT RETAINS THE CHEMICAL PROPERTIES OF THAT COMPOUND. FOR INSTANCE, A WATER MOLECULE IS MADE UP OF TWO HYDROGEN ATOMS BONDED TO ONE OXYGEN ATOM. THE WAY ATOMS BOND TOGETHER IS GOVERNED BY THE RULES OF ELECTRON INTERACTIONS, LEADING TO DIFFERENT TYPES OF CHEMICAL BONDS.

COVALENT BONDS: SHARING IS CARING

A COVALENT BOND IS FORMED WHEN ATOMS SHARE ELECTRONS TO ACHIEVE A STABLE ELECTRON CONFIGURATION. THIS TYPE OF BOND IS COMMON BETWEEN NONMETAL ATOMS. FOR EXAMPLE, IN A WATER MOLECULE (H_2O), THE OXYGEN ATOM SHARES ELECTRONS WITH TWO HYDROGEN ATOMS. THIS SHARING ALLOWS EACH ATOM TO COMPLETE ITS OUTERMOST ELECTRON SHELL, A STATE OF GREATER STABILITY. THE STRENGTH OF A COVALENT BOND DEPENDS ON HOW MANY PAIRS OF ELECTRONS ARE SHARED (SINGLE, DOUBLE, OR TRIPLE BONDS).

IONIC BONDS: THE DANCE OF CHARGED IONS

AN IONIC BOND IS FORMED BY THE ELECTROSTATIC ATTRACTION BETWEEN OPPOSITELY CHARGED IONS. THIS TYPICALLY OCCURS WHEN A METAL ATOM (WHICH TENDS TO LOSE ELECTRONS) TRANSFERS ELECTRONS TO A NONMETAL ATOM (WHICH TENDS TO GAIN ELECTRONS). WHEN AN ATOM LOSES AN ELECTRON, IT BECOMES A POSITIVELY CHARGED ION CALLED A CATION. WHEN AN ATOM GAINS AN ELECTRON, IT BECOMES A NEGATIVELY CHARGED ION CALLED AN ANION. THE RESULTING POSITIVE AND NEGATIVE CHARGES ATTRACT EACH OTHER STRONGLY, FORMING AN IONIC BOND. TABLE SALT (SODIUM CHLORIDE, $NaCl$) IS A CLASSIC EXAMPLE OF A COMPOUND FORMED BY IONIC BONDS.

CHEMICAL REACTIONS: THE ART OF TRANSFORMATION

A CHEMICAL REACTION IS A PROCESS THAT INVOLVES THE REARRANGEMENT OF THE MOLECULAR OR IONIC STRUCTURE OF A SUBSTANCE, AS OPPOSED TO A CHANGE IN ITS PHYSICAL FORM. IN SIMPLER TERMS, IT'S WHEN ONE OR MORE SUBSTANCES (REACTANTS) ARE TRANSFORMED INTO ONE OR MORE DIFFERENT SUBSTANCES (PRODUCTS). THIS TRANSFORMATION INVOLVES THE BREAKING AND FORMING OF CHEMICAL BONDS, OFTEN ACCOMPANIED BY THE RELEASE OR ABSORPTION OF ENERGY.

REACTANTS AND PRODUCTS

THE SUBSTANCES THAT INITIATE A CHEMICAL REACTION ARE CALLED REACTANTS. THEY ARE THE STARTING MATERIALS. AS THE REACTION PROCEEDS, THESE REACTANTS ARE CONSUMED AND CONVERTED INTO NEW SUBSTANCES KNOWN AS PRODUCTS. A CHEMICAL EQUATION IS A SYMBOLIC REPRESENTATION OF A CHEMICAL REACTION, SHOWING THE REACTANTS ON THE LEFT SIDE AND THE PRODUCTS ON THE RIGHT SIDE, SEPARATED BY AN ARROW INDICATING THE DIRECTION OF THE REACTION. FOR EXAMPLE, THE COMBUSTION OF METHANE CAN BE REPRESENTED AS $\text{CH}_4 + 2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$, WHERE METHANE (CH_4) AND OXYGEN (O_2) ARE REACTANTS, AND CARBON DIOXIDE (CO_2) AND WATER (H_2O) ARE PRODUCTS.

TYPES OF CHEMICAL REACTIONS

CHEMICAL REACTIONS CAN BE BROADLY CATEGORIZED INTO SEVERAL TYPES, EACH WITH DISTINCT CHARACTERISTICS. SOME COMMON TYPES INCLUDE:

- **SYNTHESIS (COMBINATION) REACTIONS:** TWO OR MORE SIMPLE SUBSTANCES COMBINE TO FORM A MORE COMPLEX ONE (E.G., $\text{A} + \text{B} \rightarrow \text{AB}$).
- **DECOMPOSITION REACTIONS:** A COMPLEX SUBSTANCE BREAKS DOWN INTO TWO OR MORE SIMPLER SUBSTANCES (E.G., $\text{AB} \rightarrow \text{A} + \text{B}$).
- **SINGLE DISPLACEMENT (REPLACEMENT) REACTIONS:** A MORE REACTIVE ELEMENT DISPLACES A LESS REACTIVE ELEMENT FROM ITS COMPOUND (E.G., $\text{A} + \text{BC} \rightarrow \text{AC} + \text{B}$).
- **DOUBLE DISPLACEMENT REACTIONS:** THE POSITIVE AND NEGATIVE IONS OF TWO IONIC COMPOUNDS SWITCH PLACES, FORMING TWO NEW COMPOUNDS (E.G., $\text{AB} + \text{CD} \rightarrow \text{AD} + \text{CB}$).
- **COMBUSTION REACTIONS:** A SUBSTANCE REACTS RAPIDLY WITH OXYGEN, OFTEN PRODUCING HEAT AND LIGHT (E.G., BURNING FUEL).

UNDERSTANDING THESE REACTION TYPES HELPS CHEMISTS PREDICT THE OUTCOMES OF REACTIONS AND DESIGN NEW CHEMICAL PROCESSES.

STATES OF MATTER: A CHEMICAL PERSPECTIVE

MATTER EXISTS IN SEVERAL STATES, AND THE STATE OF A SUBSTANCE IS DETERMINED BY THE ARRANGEMENT AND MOVEMENT OF ITS CONSTITUENT PARTICLES (ATOMS OR MOLECULES) AND THE FORCES BETWEEN THEM. THE MOST COMMON STATES OF MATTER ARE SOLID, LIQUID, AND GAS.

SOLIDS, LIQUIDS, AND GASES

IN A SOLID, PARTICLES ARE TIGHTLY PACKED IN A FIXED ARRANGEMENT, VIBRATING IN PLACE. THIS GIVES SOLIDS A DEFINITE SHAPE AND VOLUME. IN A LIQUID, PARTICLES ARE STILL CLOSE TOGETHER BUT CAN MOVE PAST EACH OTHER, ALLOWING LIQUIDS TO TAKE THE SHAPE OF THEIR CONTAINER BUT MAINTAIN A DEFINITE VOLUME. IN A GAS, PARTICLES ARE FAR APART AND MOVE RANDOMLY AT HIGH SPEEDS, FILLING THE ENTIRE VOLUME OF THEIR CONTAINER.

PHASE TRANSITIONS

THE TRANSITIONS BETWEEN THESE STATES OF MATTER—MELTING, FREEZING, BOILING, CONDENSATION, SUBLIMATION, AND DEPOSITION—ARE ALL PHYSICAL CHANGES DRIVEN BY CHANGES IN TEMPERATURE AND PRESSURE. FOR EXAMPLE, HEATING A SOLID CAN CAUSE IT TO MELT INTO A LIQUID, AND FURTHER HEATING CAN CAUSE THE LIQUID TO BOIL INTO A GAS. THESE PHASE TRANSITIONS ARE CRUCIAL CHEMICAL PROCESSES OCCURRING ALL AROUND US, FROM THE WATER CYCLE TO INDUSTRIAL MANUFACTURING.

ACIDS AND BASES: A pH BALANCE

ACIDS AND BASES ARE TWO IMPORTANT CLASSES OF CHEMICAL COMPOUNDS THAT HAVE DISTINCT PROPERTIES AND PLAY CRITICAL ROLES IN MANY CHEMICAL AND BIOLOGICAL PROCESSES. THEIR INTERACTIONS ARE OFTEN MEASURED USING THE pH SCALE.

WHAT ARE ACIDS?

ACIDS ARE SUBSTANCES THAT TYPICALLY RELEASE HYDROGEN IONS (H^+) WHEN DISSOLVED IN WATER. THEY OFTEN HAVE A SOUR TASTE (THOUGH TASTING UNKNOWN CHEMICALS IS DANGEROUS!) AND CAN CAUSE CHEMICAL BURNS. COMMON EXAMPLES INCLUDE HYDROCHLORIC ACID (HCL) FOUND IN STOMACH ACID AND CITRIC ACID FOUND IN LEMONS.

WHAT ARE BASES?

BASES, ALSO KNOWN AS ALKALIS, ARE SUBSTANCES THAT TYPICALLY ACCEPT HYDROGEN IONS OR RELEASE HYDROXIDE IONS (OH^-) WHEN DISSOLVED IN WATER. THEY OFTEN FEEL SLIPPERY AND HAVE A BITTER TASTE. COMMON EXAMPLES INCLUDE SODIUM HYDROXIDE (NaOH), A STRONG BASE USED IN DRAIN CLEANERS, AND AMMONIA (NH_3), USED IN CLEANING PRODUCTS.

THE pH SCALE

THE pH SCALE IS A MEASURE OF THE ACIDITY OR ALKALINITY OF A SOLUTION. IT RANGES FROM 0 TO 14. A pH OF 7 IS NEUTRAL (LIKE PURE WATER). SOLUTIONS WITH A pH LESS THAN 7 ARE ACIDIC, AND SOLUTIONS WITH A pH GREATER THAN 7 ARE ALKALINE (OR BASIC). THE SCALE IS LOGARITHMIC, MEANING THAT A CHANGE OF ONE pH UNIT REPRESENTS A TENFOLD CHANGE IN ACIDITY OR ALKALINITY. MAINTAINING THE CORRECT pH IS VITAL FOR MANY BIOLOGICAL PROCESSES, SUCH AS ENZYME FUNCTION.

EVERYDAY CHEMISTRY IN ACTION

CHEMISTRY IS NOT CONFINED TO LABORATORIES; IT IS AN INTEGRAL PART OF OUR DAILY LIVES. FROM THE COOKING WE DO IN OUR KITCHENS TO THE MEDICATIONS WE TAKE AND THE MATERIALS THAT MAKE UP OUR HOMES AND DEVICES, CHEMISTRY IS AT PLAY. THE BROWNING OF TOAST, THE LEAVENING OF BREAD, THE EFFECTIVENESS OF DETERGENTS, THE COLORS IN OUR CLOTHING, AND THE FUNCTIONING OF OUR SMARTPHONES ALL INVOLVE INTRICATE CHEMICAL PRINCIPLES. UNDERSTANDING BASIC CHEMISTRY HELPS US MAKE INFORMED DECISIONS ABOUT OUR HEALTH, OUR ENVIRONMENT, AND THE PRODUCTS WE USE, EMPOWERING US TO BETTER NAVIGATE AND APPRECIATE THE WORLD AROUND US.

THE STUDY OF CHEMISTRY, EVEN IN ITS SIMPLEST TERMS, REVEALS THE INTERCONNECTEDNESS OF ALL MATTER AND THE

FASCINATING TRANSFORMATIONS THAT CONSTANTLY SHAPE OUR UNIVERSE. BY GRASPING THESE FUNDAMENTAL CONCEPTS, WE GAIN A DEEPER APPRECIATION FOR THE SCIENCE THAT MAKES OUR WORLD FUNCTION.

FAQ: CHEMISTRY IN SIMPLE TERMS EXPLAINED

Q: WHAT IS THE MOST FUNDAMENTAL CONCEPT IN CHEMISTRY?

A: THE MOST FUNDAMENTAL CONCEPT IN CHEMISTRY IS THE ATOM, THE BASIC BUILDING BLOCK OF ALL MATTER. UNDERSTANDING THE STRUCTURE OF ATOMS, INCLUDING PROTONS, NEUTRONS, AND ELECTRONS, AND HOW THEY COMBINE TO FORM ELEMENTS IS THE STARTING POINT FOR ALL FURTHER CHEMICAL UNDERSTANDING.

Q: HOW DO ATOMS FORM MOLECULES, AND WHY IS THIS IMPORTANT?

A: ATOMS FORM MOLECULES BY CREATING CHEMICAL BONDS, WHERE THEY SHARE OR TRANSFER ELECTRONS. THIS PROCESS IS CRUCIAL BECAUSE MOLECULES ARE THE FUNDAMENTAL UNITS OF MOST SUBSTANCES WE ENCOUNTER, FROM WATER AND AIR TO COMPLEX ORGANIC COMPOUNDS ESSENTIAL FOR LIFE. THE WAY ATOMS BOND DICTATES THE PROPERTIES OF THE RESULTING MOLECULE.

Q: WHAT IS THE PERIODIC TABLE AND WHY IS IT SO IMPORTANT IN CHEMISTRY?

A: THE PERIODIC TABLE IS A CHART THAT ORGANIZES ALL KNOWN CHEMICAL ELEMENTS BASED ON THEIR ATOMIC NUMBER, ELECTRON CONFIGURATION, AND RECURRING CHEMICAL PROPERTIES. IT IS INCREDIBLY IMPORTANT BECAUSE IT ALLOWS CHEMISTS TO PREDICT HOW ELEMENTS WILL BEHAVE AND REACT, AND IT REVEALS RELATIONSHIPS BETWEEN DIFFERENT ELEMENTS, SERVING AS A POWERFUL PREDICTIVE TOOL.

Q: CAN YOU EXPLAIN WHAT A CHEMICAL REACTION IS IN SIMPLE TERMS?

A: A CHEMICAL REACTION IS ESSENTIALLY A PROCESS WHERE SUBSTANCES CHANGE INTO NEW SUBSTANCES. IT INVOLVES REARRANGING ATOMS AND MOLECULES, BREAKING EXISTING CHEMICAL BONDS AND FORMING NEW ONES. THINK OF IT LIKE TAKING LEGO BRICKS APART AND BUILDING SOMETHING ENTIRELY DIFFERENT WITH THEM.

Q: WHAT IS THE DIFFERENCE BETWEEN A PHYSICAL CHANGE AND A CHEMICAL CHANGE?

A: A PHYSICAL CHANGE ALTERS THE FORM OR APPEARANCE OF A SUBSTANCE BUT DOES NOT CHANGE ITS CHEMICAL COMPOSITION. FOR EXAMPLE, MELTING ICE IS A PHYSICAL CHANGE BECAUSE IT TURNS INTO LIQUID WATER, BUT IT'S STILL H_2O . A CHEMICAL CHANGE, ON THE OTHER HAND, RESULTS IN THE FORMATION OF NEW SUBSTANCES WITH DIFFERENT CHEMICAL PROPERTIES. BURNING WOOD IS A CHEMICAL CHANGE BECAUSE IT TRANSFORMS INTO ASH, SMOKE, AND GASES.

Q: WHY ARE ACIDS AND BASES IMPORTANT IN EVERYDAY LIFE?

A: ACIDS AND BASES ARE ESSENTIAL IN NUMEROUS EVERYDAY APPLICATIONS. ACIDS ARE FOUND IN OUR DIGESTIVE SYSTEM TO BREAK DOWN FOOD, AND BASES ARE USED IN CLEANING PRODUCTS. THE BALANCE OF ACIDS AND BASES, MEASURED BY pH, IS CRITICAL FOR THE HEALTH OF OUR BODIES, THE ENVIRONMENT (LIKE SOIL AND WATER pH), AND THE EFFECTIVENESS OF MANY INDUSTRIAL PROCESSES.

Q: WHAT ARE THE THREE MAIN STATES OF MATTER, AND WHAT DETERMINES THEM?

A: THE THREE MAIN STATES OF MATTER ARE SOLID, LIQUID, AND GAS. THESE STATES ARE DETERMINED BY HOW TIGHTLY THE PARTICLES (ATOMS OR MOLECULES) ARE PACKED AND HOW MUCH THEY MOVE. SOLIDS HAVE TIGHTLY PACKED, VIBRATING

PARTICLES; LIQUIDS HAVE PARTICLES THAT ARE CLOSE BUT CAN MOVE PAST EACH OTHER; AND GASES HAVE PARTICLES THAT ARE FAR APART AND MOVE FREELY.

Q: HOW DOES THE CONCEPT OF "SHARING" APPLY TO CHEMICAL BONDS?

A: THE CONCEPT OF "SHARING" APPLIES TO COVALENT BONDS. IN A COVALENT BOND, ATOMS SHARE ELECTRONS IN THEIR OUTERMOST SHELLS TO ACHIEVE A MORE STABLE ELECTRON CONFIGURATION, MUCH LIKE TWO PEOPLE SHARING RESOURCES TO BENEFIT BOTH. THIS SHARING ALLOWS THE ATOMS TO STICK TOGETHER AND FORM MOLECULES.
