

# COLLEGE ALGEBRA EXPONENTIAL EQUATION PRACTICE

COLLEGE ALGEBRA EXPONENTIAL EQUATION PRACTICE IS A CRUCIAL SKILL FOR STUDENTS NAVIGATING ADVANCED MATHEMATICS. MASTERING THESE EQUATIONS UNLOCKS UNDERSTANDING OF GROWTH, DECAY, AND VARIOUS NATURAL PHENOMENA. THIS COMPREHENSIVE GUIDE DELVES INTO THE CORE CONCEPTS OF SOLVING EXPONENTIAL EQUATIONS, OFFERING DETAILED EXPLANATIONS, PRACTICAL EXAMPLES, AND ESSENTIAL STRATEGIES TO BUILD CONFIDENCE. WE WILL EXPLORE THE PROPERTIES OF EXPONENTS, LOGARITHMIC TRANSFORMATIONS, AND COMMON PITFALLS TO AVOID. WHETHER YOU ARE PREPARING FOR EXAMS OR SEEKING TO SOLIDIFY YOUR GRASP OF THE SUBJECT, THIS RESOURCE PROVIDES THE FOCUSED PRACTICE YOU NEED.

## UNDERSTANDING EXPONENTIAL EQUATIONS

EXPONENTIAL EQUATIONS ARE MATHEMATICAL EXPRESSIONS WHERE THE VARIABLE APPEARS IN THE EXPONENT. THESE EQUATIONS ARE FUNDAMENTAL TO MODELING REAL-WORLD SCENARIOS SUCH AS POPULATION GROWTH, RADIOACTIVE DECAY, COMPOUND INTEREST, AND EVEN THE SPREAD OF DISEASES. AT THEIR CORE, THEY INVOLVE A BASE RAISED TO A POWER THAT INCLUDES THE UNKNOWN. FOR INSTANCE, AN EQUATION LIKE  $2^x = 8$  IS A SIMPLE EXAMPLE, WHILE MORE COMPLEX FORMS MIGHT INVOLVE MULTIPLE TERMS OR VARIABLES IN THE EXPONENT. DEVELOPING PROFICIENCY IN SOLVING THESE TYPES OF EQUATIONS IS A CORNERSTONE OF SUCCESS IN COLLEGE ALGEBRA.

THE STRUCTURE OF AN EXPONENTIAL EQUATION, SUCH AS  $b^x = y$ , WHERE  $b$  IS THE BASE (A POSITIVE NUMBER NOT EQUAL TO 1),  $x$  IS THE EXPONENT (WHICH CONTAINS THE VARIABLE), AND  $y$  IS THE RESULT, DICTATES THE METHODS USED FOR SOLVING. UNDERSTANDING THIS BASIC FORM IS THE FIRST STEP TOWARDS TACKLING MORE INTRICATE PROBLEMS. THE RELATIONSHIP BETWEEN EXPONENTIAL AND LOGARITHMIC FUNCTIONS IS ALSO INTRINSICALLY LINKED, AND THIS CONNECTION IS VITAL FOR MASTERING EXPONENTIAL EQUATION PRACTICE.

## PROPERTIES OF EXPONENTS: THE FOUNDATION

BEFORE DIVING INTO SOLVING EXPONENTIAL EQUATIONS, A FIRM UNDERSTANDING OF EXPONENT PROPERTIES IS ABSOLUTELY ESSENTIAL. THESE RULES GOVERN HOW EXPONENTS INTERACT, SIMPLIFYING EXPRESSIONS AND ENABLING US TO MANIPULATE EQUATIONS EFFECTIVELY. WITHOUT A SOLID GRASP OF THESE PROPERTIES, ATTEMPTING COMPLEX PROBLEMS WILL BE AN UPHILL BATTLE. THEY ARE THE BEDROCK UPON WHICH ALL EXPONENTIAL EQUATION SOLVING TECHNIQUES ARE BUILT.

### PRODUCT OF POWERS

WHEN MULTIPLYING EXPONENTIAL TERMS WITH THE SAME BASE, YOU ADD THEIR EXPONENTS. THIS IS REPRESENTED AS  $a^m \cdot a^n = a^{m+n}$ . FOR EXAMPLE,  $3^2 \cdot 3^4 = 3^{2+4} = 3^6$ . THIS RULE IS CRUCIAL FOR SIMPLIFYING EXPRESSIONS AND ISOLATING VARIABLES WITHIN EXPONENTS.

## Quotient of Powers

When dividing exponential terms with the same base, you subtract their exponents. This is written as  $\frac{a^m}{a^n} = a^{m-n}$ . An example is  $\frac{5^7}{5^3} = 5^{7-3} = 5^4$ . This property is equally important for simplification and rearrangement of terms in exponential equations.

## Power of a Power

When raising an exponential term to another power, you multiply the exponents. The rule is  $(a^m)^n = a^{m \cdot n}$ . For instance,  $(4^3)^2 = 4^{3 \cdot 2} = 4^6$ . This is a common operation when variables are nested within exponents.

## Zero Exponent

Any non-zero base raised to the power of zero equals one. This is stated as  $a^0 = 1$  (where  $a \neq 0$ ). This property can be used to simplify expressions or to eliminate terms from an equation.

## Negative Exponents

A base raised to a negative exponent is equal to the reciprocal of the base raised to the positive exponent. This is defined as  $a^{-n} = \frac{1}{a^n}$  (where  $a \neq 0$ ). Understanding this allows us to convert expressions with negative exponents to a more manageable form.

## Solving Exponential Equations: Key Strategies

Solving exponential equations often involves manipulating the equation to isolate the exponential term and then employing specific techniques. The goal is to transform the equation into a form where the variable can be readily solved. While some simple equations can be solved by inspection, most require a systematic approach. The strategies employed depend heavily on whether the bases on both sides of the equation can be made the same.

## Equating Bases

The most straightforward method for solving exponential equations is to rewrite both sides of the equation with the same base. If you can express both  $b^x$  and  $y$  as powers of the same base, say  $b^m = b^n$ , then you can equate the exponents:  $m = n$ . This technique relies on the one-to-one property of exponential functions. For example, to solve  $3^{x+1} = 27$ , you recognize that  $27$  can be written as  $3^3$ . Thus, the equation becomes  $3^{x+1} = 3^3$ , leading to  $x+1 = 3$ , and  $x=2$ . This method is ideal when possible.

## Isolating the Exponential Term

In many cases, the exponential term may not be directly isolated. Before attempting to equate bases or use logarithms, it's essential to perform algebraic operations to get the exponential expression by itself on one side of the equation. This might involve addition, subtraction, multiplication, or division of constants or other variables. For example, in an equation like  $2 \cdot 5^x = 50$ , you would first divide both sides by 2 to get  $5^x = 25$ , and then proceed to solve.

# THE ROLE OF LOGARITHMS IN SOLVING EXPONENTIAL EQUATIONS

WHEN THE BASES OF AN EXPONENTIAL EQUATION CANNOT BE EASILY EQUATED, LOGARITHMS BECOME AN INDISPENSABLE TOOL. LOGARITHMS ARE THE INVERSE OPERATION OF EXPONENTIATION. THEY ALLOW US TO "BRING DOWN" THE EXPONENT, TRANSFORMING AN EXPONENTIAL EQUATION INTO A LINEAR ONE THAT CAN BE SOLVED USING STANDARD ALGEBRAIC METHODS. UNDERSTANDING THE PROPERTIES OF LOGARITHMS IS AS CRITICAL AS UNDERSTANDING EXPONENT PROPERTIES FOR MASTERING COLLEGE ALGEBRA EXPONENTIAL EQUATION PRACTICE.

## UNDERSTANDING LOGARITHMS

A LOGARITHM ANSWERS THE QUESTION: "TO WHAT POWER MUST A BASE BE RAISED TO OBTAIN A CERTAIN NUMBER?" THE EQUATION  $b^x = y$  IS EQUIVALENT TO  $\log_b y = x$ . THE BASE  $b$  IS THE SAME IN BOTH THE EXPONENTIAL AND LOGARITHMIC FORMS. COMMON LOGARITHMS (BASE 10) ARE WRITTEN AS  $\log$  OR  $\log_{10}$ , AND NATURAL LOGARITHMS (BASE  $e$ ) ARE WRITTEN AS  $\ln$  OR  $\log_e$ . THESE CAN BE USED INTERCHANGEABLY DEPENDING ON THE PROBLEM CONTEXT AND CALCULATOR AVAILABILITY.

## USING LOGARITHMS TO SOLVE

TO SOLVE AN EXPONENTIAL EQUATION WHERE BASES CANNOT BE EQUATED, TAKE THE LOGARITHM OF BOTH SIDES. IT'S OFTEN CONVENIENT TO USE EITHER THE COMMON LOGARITHM OR THE NATURAL LOGARITHM, AS THESE ARE READILY AVAILABLE ON MOST CALCULATORS. FOR AN EQUATION LIKE  $5^x = 12$ , YOU WOULD TAKE THE LOGARITHM OF BOTH SIDES:  $\log(5^x) = \log(12)$ . USING THE POWER RULE OF LOGARITHMS ( $\log(a^b) = b \log(a)$ ), THIS BECOMES  $x \log(5) = \log(12)$ . FINALLY, SOLVE FOR  $x$  BY DIVIDING:  $x = \frac{\log(12)}{\log(5)}$ .

## PROPERTIES OF LOGARITHMS FOR SOLVING

SEVERAL KEY LOGARITHM PROPERTIES ARE REPEATEDLY USED WHEN SOLVING EXPONENTIAL EQUATIONS. THESE MIRROR THE PROPERTIES OF EXPONENTS:

- PRODUCT RULE:  $\log_b(MN) = \log_b M + \log_b N$
- QUOTIENT RULE:  $\log_b\left(\frac{M}{N}\right) = \log_b M - \log_b N$
- POWER RULE:  $\log_b(M^p) = p \log_b M$
- CHANGE OF BASE FORMULA:  $\log_b M = \frac{\log_c M}{\log_c b}$  (USEFUL FOR CALCULATOR USE)

THESE PROPERTIES ALLOW US TO EXPAND, CONDENSE, AND MANIPULATE LOGARITHMIC EXPRESSIONS, WHICH IS ESSENTIAL FOR ISOLATING THE VARIABLE IN EXPONENTIAL EQUATIONS.

## COMMON CHALLENGES IN COLLEGE ALGEBRA EXPONENTIAL EQUATION PRACTICE

WHILE THE PRINCIPLES OF SOLVING EXPONENTIAL EQUATIONS ARE CONSISTENT, STUDENTS OFTEN ENCOUNTER SPECIFIC DIFFICULTIES. RECOGNIZING THESE COMMON PITFALLS IS A CRUCIAL STEP IN IMPROVING PROBLEM-SOLVING ACCURACY AND EFFICIENCY. THESE CHALLENGES OFTEN STEM FROM A MISUNDERSTANDING OF THE FUNDAMENTAL PROPERTIES OR A LACK OF CAREFUL ALGEBRAIC MANIPULATION.

## CONFUSING EXPONENT AND LOGARITHM RULES

A FREQUENT ERROR IS MIXING UP THE RULES FOR EXPONENTS AND LOGARITHMS. FOR EXAMPLE, INCORRECTLY APPLYING THE PRODUCT RULE OF EXPONENTS TO LOGARITHMS OR VICE-VERSA. IT'S VITAL TO HAVE A CLEAR DISTINCTION BETWEEN THESE TWO SETS OF RULES AND TO PRACTICE APPLYING THEM IN THEIR CORRECT CONTEXTS. CONSISTENT REVIEW AND TARGETED PRACTICE PROBLEMS ARE KEY TO SOLIDIFYING THIS UNDERSTANDING.

## ERRORS IN ALGEBRAIC MANIPULATION

EVEN WITH A CORRECT UNDERSTANDING OF THE UNDERLYING MATHEMATICAL PRINCIPLES, SIMPLE ALGEBRAIC MISTAKES CAN LEAD TO INCORRECT ANSWERS. THIS INCLUDES ERRORS IN DISTRIBUTING NEGATIVE SIGNS, COMBINING LIKE TERMS, OR INCORRECTLY APPLYING THE ORDER OF OPERATIONS. CAREFUL, STEP-BY-STEP WORK AND DOUBLE-CHECKING EACH CALCULATION ARE IMPERATIVE.

## APPROXIMATING LOGARITHMS INCORRECTLY

WHEN USING LOGARITHMS TO SOLVE EQUATIONS, STUDENTS MAY MAKE ERRORS WHEN CALCULATING OR ROUNDING THE VALUES OF LOGARITHMS. IT'S IMPORTANT TO UNDERSTAND WHEN AN EXACT ANSWER IS REQUIRED VERSUS WHEN AN APPROXIMATION IS ACCEPTABLE, AND TO USE THE APPROPRIATE NUMBER OF DECIMAL PLACES AS INSTRUCTED. USING A CALCULATOR ACCURATELY AND CONSISTENTLY IS A SKILL THAT NEEDS TO BE HONED.

## MISINTERPRETING THE BASE OF A LOGARITHM

FORGETTING THE BASE OF A LOGARITHM, OR ASSUMING A BASE WHEN IT'S NOT EXPLICITLY STATED (E.G., ASSUMING  $\log$  ALWAYS MEANS BASE 10), CAN LEAD TO SIGNIFICANT ERRORS. ALWAYS PAY CLOSE ATTENTION TO THE SUBSCRIPT INDICATING THE BASE OF THE LOGARITHM OR REMEMBER THE CONVENTIONS FOR COMMON AND NATURAL LOGARITHMS. THIS DETAIL IS CRITICAL FOR ACCURATE PROBLEM-SOLVING.

## ADVANCED TECHNIQUES AND APPLICATIONS

BEYOND THE FUNDAMENTAL METHODS, COLLEGE ALGEBRA OFTEN INTRODUCES MORE COMPLEX SCENARIOS INVOLVING EXPONENTIAL EQUATIONS. THESE MAY INCLUDE EQUATIONS WITH MULTIPLE EXPONENTIAL TERMS, OR APPLICATIONS THAT REQUIRE SETTING UP AN EXPONENTIAL MODEL BEFORE SOLVING.

## EQUATIONS WITH MULTIPLE EXPONENTIAL TERMS

SOME EXPONENTIAL EQUATIONS CONTAIN MORE THAN ONE TERM WITH THE VARIABLE IN THE EXPONENT. THESE MIGHT BE SOLVED BY SUBSTITUTION OR BY FACTORING. FOR EXAMPLE, AN EQUATION LIKE  $4^x - 3 \cdot 2^x - 4 = 0$  CAN BE REWRITTEN. RECOGNIZING THAT  $4^x = (2^x)^2$ , WE CAN LET  $u = 2^x$ , TRANSFORMING THE EQUATION INTO A QUADRATIC:  $u^2 - 3u - 4 = 0$ . THIS QUADRATIC CAN THEN BE FACTORED, AND THE VALUE OF  $u$  CAN BE USED TO SOLVE FOR  $x$ . THIS TECHNIQUE IS INVALUABLE FOR COMPLEX PROBLEM-SOLVING.

## EXPONENTIAL GROWTH AND DECAY MODELS

EXPONENTIAL EQUATIONS ARE THE BACKBONE OF MODELING REAL-WORLD PHENOMENA LIKE POPULATION GROWTH, RADIOACTIVE DECAY, AND COMPOUND INTEREST. THE GENERAL FORM FOR EXPONENTIAL GROWTH AND DECAY IS  $A(t) = A_0 e^{kt}$  OR  $A(t) = A_0 (1+r)^t$ , WHERE  $A(t)$  IS THE AMOUNT AT TIME  $t$ ,  $A_0$  IS THE INITIAL AMOUNT,  $k$  IS THE GROWTH/DECAY RATE, AND  $r$  IS THE INTEREST RATE. PROBLEMS INVOLVING THESE MODELS OFTEN REQUIRE SOLVING FOR TIME ( $t$ ), INITIAL AMOUNT ( $A_0$ ), OR THE RATE ( $k$  OR  $r$ ), USING THE TECHNIQUES DISCUSSED PREVIOUSLY.

## INEQUALITIES INVOLVING EXPONENTIAL FUNCTIONS

SIMILAR TO SOLVING EXPONENTIAL EQUATIONS, EXPONENTIAL INEQUALITIES INVOLVE COMPARING TWO EXPONENTIAL EXPRESSIONS. IF THE BASE IS GREATER THAN 1, THE INEQUALITY DIRECTION REMAINS THE SAME WHEN COMPARING EXPONENTS. IF THE BASE IS BETWEEN 0 AND 1, THE INEQUALITY DIRECTION REVERSES. FOR EXAMPLE, IF  $2^x > 8$ , THEN  $x > 3$ . IF  $(\frac{1}{2})^x > \frac{1}{8}$ , THEN  $x < 3$ . UNDERSTANDING THIS BEHAVIOR IS CRUCIAL FOR CORRECTLY SOLVING EXPONENTIAL INEQUALITIES.

## PUTTING IT ALL TOGETHER: PRACTICE PROBLEMS AND SOLUTIONS

CONSISTENT PRACTICE IS THE MOST EFFECTIVE WAY TO MASTER COLLEGE ALGEBRA EXPONENTIAL EQUATION PRACTICE. WORKING THROUGH A VARIETY OF PROBLEMS, FROM SIMPLE TO COMPLEX, HELPS REINFORCE CONCEPTS AND BUILD CONFIDENCE. THE FOLLOWING EXAMPLES ILLUSTRATE THE APPLICATION OF THE STRATEGIES DISCUSSED.

### EXAMPLE 1: EQUATING BASES

SOLVE FOR  $x$ :  $9^{x+2} = 27^x$ .

RECOGNIZE THAT BOTH 9 AND 27 CAN BE EXPRESSED AS POWERS OF 3:  $9 = 3^2$  AND  $27 = 3^3$ .

SUBSTITUTE THESE INTO THE EQUATION:  $(3^2)^{x+2} = (3^3)^x$ .

APPLY THE POWER OF A POWER RULE:  $3^{2(x+2)} = 3^{3x}$ .

SIMPLIFY THE EXPONENTS:  $3^{2x+4} = 3^{3x}$ .

SINCE THE BASES ARE THE SAME, EQUATE THE EXPONENTS:  $2x+4 = 3x$ .

SOLVE FOR  $x$ :  $4 = 3x - 2x$  IMPLIES  $x = 4$ .

CHECK:  $9^{4+2} = 9^6 = (3^2)^6 = 3^{12}$ . AND  $27^4 = (3^3)^4 = 3^{12}$ . THE SOLUTION IS CORRECT.

### EXAMPLE 2: USING LOGARITHMS

SOLVE FOR  $x$ :  $3 \cdot 7^x = 10$ .

FIRST, ISOLATE THE EXPONENTIAL TERM:  $7^x = \frac{10}{3}$ .

NOW, TAKE THE NATURAL LOGARITHM (OR COMMON LOGARITHM) OF BOTH SIDES:  $\ln(7^x) = \ln(\frac{10}{3})$ .

USE THE POWER RULE OF LOGARITHMS:  $x \ln(7) = \ln(\frac{10}{3})$ .

SOLVE FOR  $x$ :  $x = \frac{\ln(\frac{10}{3})}{\ln(7)}$ .

USING A CALCULATOR,  $x \approx \frac{0.9808}{1.9459} \approx 0.504$ . THIS PROVIDES AN APPROXIMATE NUMERICAL SOLUTION.

### EXAMPLE 3: APPLICATION - COMPOUND INTEREST

AN INVESTMENT OF \$5,000 GROWS AT AN ANNUAL INTEREST RATE OF 4%, COMPOUNDED CONTINUOUSLY. HOW LONG WILL IT TAKE FOR THE INVESTMENT TO DOUBLE?

THE FORMULA FOR CONTINUOUS COMPOUNDING IS  $A = Pe^{rt}$ , WHERE  $A$  IS THE FINAL AMOUNT,  $P$  IS THE PRINCIPAL,  $r$  IS THE ANNUAL INTEREST RATE, AND  $t$  IS THE TIME IN YEARS.

WE WANT TO FIND  $t$  WHEN  $A = 2P$ . SO,  $2P = Pe^{0.04t}$ .

DIVIDE BOTH SIDES BY  $P$ :  $2 = e^{0.04t}$ .

TAKE THE NATURAL LOGARITHM OF BOTH SIDES:  $\ln(2) = \ln(e^{0.04t})$ .

USE THE PROPERTY  $\ln(e^y) = y$ :  $\ln(2) = 0.04t$ .

SOLVE FOR  $t$ :  $t = \frac{\ln(2)}{0.04}$ .

USING A CALCULATOR,  $t \approx \frac{0.6931}{0.04} \approx 17.33$  YEARS. IT WILL TAKE APPROXIMATELY 17.33 YEARS FOR THE INVESTMENT TO DOUBLE.

## FREQUENTLY ASKED QUESTIONS

### Q: WHAT IS THE MOST COMMON MISTAKE STUDENTS MAKE WHEN SOLVING COLLEGE ALGEBRA EXPONENTIAL EQUATIONS?

A: ONE OF THE MOST FREQUENT ERRORS IS CONFUSING THE RULES OF EXPONENTS WITH THE RULES OF LOGARITHMS. STUDENTS MAY INCORRECTLY APPLY PROPERTIES OR FORGET WHICH RULES APPLY TO WHICH MATHEMATICAL OPERATION.

### Q: WHEN SHOULD I USE LOGARITHMS TO SOLVE AN EXPONENTIAL EQUATION?

A: YOU SHOULD USE LOGARITHMS WHEN IT IS NOT POSSIBLE TO REWRITE BOTH SIDES OF THE EQUATION WITH THE SAME BASE. THIS IS TYPICALLY THE CASE WHEN THE NUMBERS INVOLVED DO NOT SHARE A COMMON INTEGER EXPONENT RELATIONSHIP.

### Q: HOW DOES THE CHANGE OF BASE FORMULA HELP WITH EXPONENTIAL EQUATION PRACTICE?

A: THE CHANGE OF BASE FORMULA ALLOWS YOU TO CONVERT LOGARITHMS FROM ANY BASE TO A BASE THAT IS READILY AVAILABLE ON YOUR CALCULATOR, USUALLY BASE 10 (COMMON LOG) OR BASE  $e$  (NATURAL LOG). THIS IS ESSENTIAL FOR FINDING NUMERICAL SOLUTIONS.

### Q: WHAT IS THE DIFFERENCE BETWEEN SOLVING EXPONENTIAL EQUATIONS AND EXPONENTIAL INEQUALITIES?

A: SOLVING EXPONENTIAL EQUATIONS INVOLVES FINDING A SPECIFIC VALUE FOR THE VARIABLE, WHEREAS SOLVING EXPONENTIAL INEQUALITIES INVOLVES FINDING A RANGE OF VALUES. THE PROCESS IS SIMILAR, BUT THE FINAL ANSWER FOR AN INEQUALITY WILL BE AN INTERVAL OR A SET OF INTERVALS, AND THE DIRECTION OF THE INEQUALITY MAY FLIP DEPENDING ON THE BASE.

### Q: CAN EXPONENTIAL EQUATIONS BE SOLVED GRAPHICALLY?

A: YES, EXPONENTIAL EQUATIONS CAN BE SOLVED GRAPHICALLY BY PLOTTING BOTH SIDES OF THE EQUATION AS FUNCTIONS AND FINDING THE X-COORDINATE(S) OF THE INTERSECTION POINT(S). THIS METHOD IS USEFUL FOR VISUALIZING SOLUTIONS AND FOR CHECKING ALGEBRAIC RESULTS, ESPECIALLY WHEN ANALYTICAL SOLUTIONS ARE COMPLEX.

### Q: WHAT DOES IT MEAN TO "EQUATE THE BASES" IN AN EXPONENTIAL EQUATION?

A: "EQUATING THE BASES" MEANS REWRITING BOTH SIDES OF AN EXPONENTIAL EQUATION SO THAT THEY HAVE THE SAME NUMERICAL BASE. FOR EXAMPLE, IF YOU HAVE  $4^x = 8$ , YOU CAN REWRITE BOTH SIDES AS POWERS OF 2:  $(2^2)^x = 2^3$ , WHICH SIMPLIFIES TO  $2^{2x} = 2^3$ . ONCE THE BASES ARE THE SAME, YOU CAN SET THE EXPONENTS EQUAL TO EACH OTHER.

### Q: ARE THERE ANY SPECIAL CONSIDERATIONS FOR EXPONENTIAL EQUATIONS WITH FRACTIONAL OR NEGATIVE BASES?

A: IN COLLEGE ALGEBRA, THE BASE OF AN EXPONENTIAL FUNCTION IS TYPICALLY DEFINED AS A POSITIVE NUMBER NOT EQUAL TO 1. IF A PROBLEM PRESENTS AN EXPONENTIAL EXPRESSION WITH A NEGATIVE BASE, IT'S OFTEN EITHER A TYPO OR INTENDED TO BE WITHIN A SPECIFIC DOMAIN WHERE SUCH EXPRESSIONS ARE WELL-DEFINED, WHICH IS LESS COMMON IN STANDARD EXPONENTIAL EQUATION PRACTICE. FRACTIONAL BASES (E.G.,  $1/2$ ) ARE HANDLED LIKE ANY OTHER BASE GREATER THAN 0 AND NOT EQUAL TO 1, WITH THE UNDERSTANDING THAT POWERS OF FRACTIONS BEHAVE DIFFERENTLY.
