UNDERSTANDING THE MATHEMATICAL FOUNDATION OF CHEMISTRY

CHEMISTRY, AT ITS CORE, IS A QUANTITATIVE SCIENCE. WHILE CONCEPTUAL UNDERSTANDING IS VITAL, THE ABILITY TO PERFORM CALCULATIONS, MODEL PHENOMENA, AND ANALYZE DATA RELIES HEAVILY ON MATHEMATICAL PROFICIENCY. COLLEGE ALGEBRA PROVIDES THE ESSENTIAL TOOLKIT FOR THIS QUANTITATIVE LITERACY. WITHOUT A SOLID GRASP OF ALGEBRAIC MANIPULATION, STUDENTS WILL FIND THEMSELVES STRUGGLING TO MOVE BEYOND BASIC DESCRIPTIVE CHEMISTRY AND INTO THE PREDICTIVE AND ANALYTICAL ASPECTS THAT DEFINE THE DISCIPLINE.

THE RELATIONSHIP BETWEEN ALGEBRA AND CHEMISTRY IS SYMBIOTIC. ALGEBRAIC PRINCIPLES ARE NOT MERELY TOOLS TO BE APPLIED; THEY ARE INTEGRAL TO THE VERY LANGUAGE AND LOGIC OF CHEMISTRY. UNDERSTANDING VARIABLES, COEFFICIENTS, EXPONENTS, AND FUNCTIONS ALLOWS CHEMISTS TO EXPRESS COMPLEX RELATIONSHIPS CONCISELY AND TO DERIVE MEANINGFUL INSIGHTS FROM EXPERIMENTAL RESULTS. THIS SECTION WILL LAY THE GROUNDWORK FOR UNDERSTANDING WHY THIS MATHEMATICAL DISCIPLINE IS SO CENTRAL TO CHEMICAL EDUCATION.

ESSENTIAL ALGEBRAIC CONCEPTS FOR CHEMISTRY

SEVERAL KEY AREAS WITHIN COLLEGE ALGEBRA ARE DIRECTLY AND FREQUENTLY APPLIED IN CHEMISTRY. MASTERING THESE CONCEPTS WILL SIGNIFICANTLY ENHANCE A STUDENT'S ABILITY TO SUCCEED IN THEIR CHEMISTRY COURSEWORK. THESE ARE THE BUILDING BLOCKS UPON WHICH MORE COMPLEX CHEMICAL CALCULATIONS ARE CONSTRUCTED, AND A FIRM GRASP OF EACH IS PARAMOUNT.

VARIABLES, CONSTANTS, AND UNIT CONVERSIONS

AT THE MOST FUNDAMENTAL LEVEL, CHEMISTRY DEALS WITH QUANTITIES THAT CAN VARY (VARIABLES) AND QUANTITIES THAT

REMAIN FIXED (CONSTANTS). ALGEBRAIC EXPRESSIONS USE SYMBOLS TO REPRESENT THESE, ALLOWING FOR GENERAL STATEMENTS AND CALCULATIONS. CRUCIALLY, EVERY CHEMICAL QUANTITY HAS A UNIT ASSOCIATED WITH IT. COLLEGE ALGEBRA TEACHES THE PRINCIPLES OF MANIPULATING THESE UNITS, WHICH IS ABSOLUTELY CRITICAL IN CHEMISTRY. FOR INSTANCE, CONVERTING BETWEEN GRAMS AND KILOGRAMS, MILLILITERS AND LITERS, OR CELSIUS AND KELVIN REQUIRES UNDERSTANDING DIMENSIONAL ANALYSIS, A TECHNIQUE DEEPLY ROOTED IN ALGEBRAIC MANIPULATION.

FOR EXAMPLE, WHEN CALCULATING THE MOLAR MASS OF A COMPOUND, YOU SUM THE ATOMIC MASSES OF ITS CONSTITUENT ELEMENTS. EACH ATOMIC MASS HAS UNITS (E.G., GRAMS PER MOLE). THE FINAL MOLAR MASS WILL INHERIT THESE UNITS, AND WITHOUT PROPER ALGEBRAIC HANDLING OF THESE UNITS, THE FINAL ANSWER WOULD BE MEANINGLESS. SIMILARLY, IN GAS LAW CALCULATIONS, ENSURING ALL PRESSURE, VOLUME, AND TEMPERATURE VALUES ARE IN COMPATIBLE UNITS IS A DIRECT APPLICATION OF ALGEBRAIC UNIT CANCELLATION.

SOLVING LINEAR EQUATIONS

MANY FUNDAMENTAL CHEMICAL RELATIONSHIPS CAN BE EXPRESSED AS LINEAR EQUATIONS. THESE ARE EQUATIONS WHERE THE HIGHEST POWER OF THE VARIABLE IS ONE. SOLVING THESE EQUATIONS INVOLVES ISOLATING THE UNKNOWN VARIABLE ON ONE SIDE OF THE EQUATION USING INVERSE OPERATIONS. THIS SKILL IS APPLIED IN COUNTLESS SCENARIOS:

- CALCULATING THE AMOUNT OF A REACTANT NEEDED GIVEN A DESIRED PRODUCT YIELD.
- DETERMINING AN UNKNOWN CONCENTRATION WHEN GIVEN VOLUME AND MOLARITY.
- FINDING THE TEMPERATURE OF A SYSTEM WHEN ENERGY AND HEAT CAPACITY ARE KNOWN.
- SOLVING FOR THE RATE CONSTANT IN A FIRST-ORDER REACTION.

THE PROCESS OF ALGEBRAIC MANIPULATION, SUCH AS ADDING OR SUBTRACTING THE SAME VALUE FROM BOTH SIDES OF AN EQUATION, OR MULTIPLYING OR DIVIDING BOTH SIDES BY THE SAME NON-ZERO VALUE, IS THE BEDROCK OF CHEMICAL PROBLEM-SOLVING. PROFICIENCY HERE DIRECTLY TRANSLATES TO EFFICIENCY AND ACCURACY IN CHEMICAL CALCULATIONS.

EXPONENTS AND POWERS

EXPONENTS PLAY A SIGNIFICANT ROLE IN CHEMISTRY, PARTICULARLY WHEN DEALING WITH SCIENTIFIC NOTATION, REACTION RATES, AND EQUILIBRIUM EXPRESSIONS. UNDERSTANDING THE RULES OF EXPONENTS—SUCH AS ADDING EXPONENTS WHEN MULTIPLYING TERMS WITH THE SAME BASE, OR SUBTRACTING EXPONENTS WHEN DIVIDING—IS ESSENTIAL FOR SIMPLIFYING AND CALCULATING VALUES. SCIENTIFIC NOTATION, WHICH USES POWERS OF 10, IS UBIQUITOUS IN CHEMISTRY FOR REPRESENTING VERY LARGE OR VERY SMALL NUMBERS ENCOUNTERED IN ATOMIC AND MOLECULAR SCALES.

FOR INSTANCE, AVOGADRO'S NUMBER (APPROXIMATELY 6.022×10^{23}) IS A PRIME EXAMPLE OF SCIENTIFIC NOTATION. WHEN PERFORMING CALCULATIONS INVOLVING THIS NUMBER, SUCH AS CONVERTING MOLES TO THE NUMBER OF ATOMS, CORRECTLY APPLYING EXPONENT RULES IS VITAL. RATE LAWS, WHICH DESCRIBE HOW REACTION RATES DEPEND ON REACTANT CONCENTRATIONS, OFTEN INVOLVE CONCENTRATIONS RAISED TO SPECIFIC POWERS, REFLECTING THE REACTION ORDER. EQUILIBRIUM CONSTANT EXPRESSIONS ALSO UTILIZE EXPONENTS DERIVED FROM THE STOICHIOMETRY OF THE BALANCED CHEMICAL EQUATION.

FUNCTIONS AND THEIR APPLICATIONS IN CHEMISTRY

THE CONCEPT OF A FUNCTION, WHERE ONE QUANTITY DEPENDS ON ANOTHER, IS CENTRAL TO UNDERSTANDING MANY CHEMICAL PROCESSES. IN ALGEBRA, A FUNCTION DESCRIBES A RELATIONSHIP WHERE EACH INPUT HAS EXACTLY ONE OUTPUT. THIS ABSTRACT IDEA TRANSLATES INTO TANGIBLE CHEMICAL RELATIONSHIPS THAT CAN BE GRAPHED AND ANALYZED.

LINEAR FUNCTIONS AND EMPIRICAL FORMULAS

LINEAR FUNCTIONS ARE OFTEN USED TO MODEL RELATIONSHIPS WHERE THERE IS A CONSTANT RATE OF CHANGE. IN CHEMISTRY, THIS CAN BE SEEN IN DIRECT PROPORTIONALITY. FOR EXAMPLE, THE MASS OF A SUBSTANCE IS DIRECTLY PROPORTIONAL TO THE NUMBER OF MOLES OF THAT SUBSTANCE ($m = n \times \text{molar mass}$). IF MOLAR MASS IS CONSIDERED THE SLOPE OF A LINE, THEN MASS IS A LINEAR FUNCTION OF MOLES. UNDERSTANDING HOW TO INTERPRET THE SLOPE AND INTERCEPT OF SUCH A LINE CAN REVEAL CRITICAL CHEMICAL PROPERTIES. EMPIRICAL FORMULAS, WHILE DETERMINED THROUGH EXPERIMENTAL DATA ANALYSIS, OFTEN INVOLVE GRAPHICAL REPRESENTATIONS THAT CAN BE APPROXIMATED BY LINEAR FUNCTIONS WHEN PLOTTING CERTAIN RELATED QUANTITIES.

POLYNOMIAL AND RATIONAL FUNCTIONS

WHILE LINEAR FUNCTIONS ARE COMMON, MORE COMPLEX CHEMICAL RELATIONSHIPS MAY BE DESCRIBED BY POLYNOMIAL OR RATIONAL FUNCTIONS. POLYNOMIAL FUNCTIONS INVOLVE VARIABLES RAISED TO NON-NEGATIVE INTEGER POWERS, WHILE RATIONAL FUNCTIONS ARE RATIOS OF POLYNOMIALS. THESE ARISE IN AREAS SUCH AS:

- MODELING THE ENERGY CHANGES IN CHEMICAL REACTIONS AS A FUNCTION OF DISTANCE BETWEEN ATOMS.
- DESCRIBING THE CONCENTRATION PROFILES OF REACTANTS AND PRODUCTS OVER TIME IN COMPLEX REACTION MECHANISMS.
- REPRESENTING SOLUBILITY CURVES OR PHASE DIAGRAMS.

UNDERSTANDING HOW TO ANALYZE AND INTERPRET THE BEHAVIOR OF THESE FUNCTIONS, INCLUDING FINDING ROOTS (WHERE THE FUNCTION EQUALS ZERO) OR IDENTIFYING ASYMPTOTES (VALUES THAT A FUNCTION APPROACHES BUT NEVER REACHES), IS CRUCIAL FOR PREDICTING CHEMICAL OUTCOMES UNDER VARIOUS CONDITIONS.

LOGARITHMS AND EXPONENTIALS IN CHEMICAL KINETICS AND EQUILIBRIA

LOGARITHMIC AND EXPONENTIAL FUNCTIONS ARE INDISPENSABLE FOR DESCRIBING PROCESSES THAT INVOLVE GROWTH OR DECAY, OR THAT SPAN VAST RANGES OF VALUES. IN CHEMISTRY, THESE ARE PARTICULARLY PREVALENT IN THE STUDY OF REACTION RATES AND THE POSITION OF CHEMICAL EQUILIBRIA.

LOGARITHMIC SCALES (pH, pOH, pK_a)

THE LOGARITHMIC SCALE IS PERHAPS MOST FAMOUSLY ENCOUNTERED IN CHEMISTRY THROUGH THE pH SCALE, WHICH MEASURES THE ACIDITY OR BASICITY OF A SOLUTION. THE DEFINITION OF pH IS $-\log[H^+]$, WHERE $[H^+]$ IS THE HYDROGEN ION CONCENTRATION. THIS LOGARITHMIC RELATIONSHIP ALLOWS CHEMISTS TO EXPRESS VERY DILUTE OR CONCENTRATED HYDROGEN ION CONCENTRATIONS USING MANAGEABLE NUMBERS. SIMILARLY, pOH ($-\log[OH^-]$) AND pK_a ($-\log K_a$) ARE ALSO LOGARITHMIC MEASURES USED IN ACID-BASE CHEMISTRY AND EQUILIBRIUM STUDIES, RESPECTIVELY. UNDERSTANDING HOW TO MANIPULATE LOGARITHMS—including their inverse relationship with exponentials—is FUNDAMENTAL TO WORKING WITH THESE

EXPONENTIAL DECAY IN FIRST-ORDER REACTIONS

MANY CHEMICAL REACTIONS, ESPECIALLY THOSE THAT PROCEED UNIMOLECULARLY OR WHERE THE RATE-DETERMINING STEP INVOLVES ONLY ONE REACTANT SPECIES, FOLLOW FIRST-ORDER KINETICS. THE CONCENTRATION OF THE REACTANT IN SUCH REACTIONS DECREASES EXPONENTIALLY OVER TIME. THE INTEGRATED RATE LAW FOR A FIRST-ORDER REACTION IS OFTEN EXPRESSED IN EXPONENTIAL OR LOGARITHMIC FORM: $\ln[A]_t = -kt + \ln[A]_0$ OR $[A]_t = [A]_0 e^{-kt}$. HERE, $[A]_t$ IS THE CONCENTRATION AT TIME t , $[A]_0$ IS THE INITIAL CONCENTRATION, AND k IS THE RATE CONSTANT. SOLVING FOR ANY OF THESE VARIABLES REQUIRES A SOLID UNDERSTANDING OF EXPONENTIAL AND LOGARITHMIC MANIPULATION, INCLUDING NATURAL LOGARITHMS ($\ln$) AND THE CONSTANT e .

EQUILIBRIUM CONSTANTS (K) AND RELATIONSHIPS

THE EQUILIBRIUM CONSTANT (K) QUANTIFIES THE EXTENT TO WHICH A REVERSIBLE REACTION PROCEEDS TO COMPLETION. FOR REACTIONS INVOLVING GASES, THE EQUILIBRIUM CONSTANT CAN BE EXPRESSED IN TERMS OF PARTIAL PRESSURES (K_p) OR CONCENTRATIONS (K_c). THE CALCULATION OF K_c OFTEN INVOLVES CONCENTRATIONS RAISED TO POWERS CORRESPONDING TO THEIR STOICHIOMETRIC COEFFICIENTS IN THE BALANCED EQUATION, AND THEN MANIPULATING THESE VALUES ALGEBRAICALLY TO FIND K . UNDERSTANDING HOW K CHANGES WITH TEMPERATURE IS OFTEN DESCRIBED USING THE VAN'T HOFF EQUATION, WHICH INVOLVES LOGARITHMIC RELATIONSHIPS DERIVED FROM THERMODYNAMIC PRINCIPLES.

STOICHIOMETRY AND MOLAR CALCULATIONS

STOICHIOMETRY, THE STUDY OF THE QUANTITATIVE RELATIONSHIPS BETWEEN REACTANTS AND PRODUCTS IN CHEMICAL REACTIONS, IS A CORNERSTONE OF QUANTITATIVE CHEMISTRY. IT RELIES HEAVILY ON ALGEBRAIC PRINCIPLES TO ENSURE THAT REACTIONS ARE BALANCED AND THAT CALCULATIONS OF AMOUNTS ARE ACCURATE.

BALANCING CHEMICAL EQUATIONS

BALANCING CHEMICAL EQUATIONS INVOLVES ENSURING THAT THE NUMBER OF ATOMS OF EACH ELEMENT IS THE SAME ON BOTH THE REACTANT AND PRODUCT SIDES. THIS IS AN ALGEBRAIC PROBLEM WHERE COEFFICIENTS ARE USED AS VARIABLES THAT MUST BE DETERMINED. WHILE OFTEN SOLVED BY INSPECTION FOR SIMPLER EQUATIONS, MORE COMPLEX SYSTEMS CAN BENEFIT FROM SETTING UP A SYSTEM OF LINEAR EQUATIONS TO SOLVE FOR THE UNKNOWN COEFFICIENTS. THE MOLE RATIOS DERIVED FROM BALANCED EQUATIONS ARE THEN USED AS CONVERSION FACTORS IN STOICHIOMETRIC CALCULATIONS.

MOLE CONCEPT AND CONVERSIONS

THE MOLE IS THE FUNDAMENTAL UNIT OF AMOUNT IN CHEMISTRY. CONVERTING BETWEEN MASS, MOLES, AND THE NUMBER OF PARTICLES (ATOMS, MOLECULES) IS A CONSTANT REQUIREMENT. THESE CONVERSIONS ARE PERFORMED USING MOLAR MASS (g/mol), AVOGADRO'S NUMBER (PARTICLES/MOL), AND THE STOICHIOMETRIC COEFFICIENTS FROM BALANCED EQUATIONS. EACH STEP IN THESE MULTI-STEP CONVERSIONS IS AN ALGEBRAIC MULTIPLICATION OR DIVISION, WHERE UNITS MUST CANCEL APPROPRIATELY TO ARRIVE AT THE CORRECT FINAL UNIT.

FOR EXAMPLE, TO FIND THE MASS OF CO_2 PRODUCED FROM BURNING 10.0 g OF METHANE (CH_4), YOU WOULD NEED TO:

1. CONVERT GRAMS OF CH_4 TO MOLES OF CH_4 USING THE MOLAR MASS OF CH_4 .
2. USE THE MOLE RATIO FROM THE BALANCED EQUATION (1 MOLE CH_4 : 1 MOLE CO_2) TO FIND MOLES OF CO_2 .
3. CONVERT MOLES OF CO_2 TO GRAMS OF CO_2 USING THE MOLAR MASS OF CO_2 .

EACH OF THESE STEPS IS A DIRECT APPLICATION OF ALGEBRAIC MULTIPLICATION AND DIVISION WITH UNITS.

GAS LAWS AND ALGEBRAIC MANIPULATIONS

THE BEHAVIOR OF GASES IS DESCRIBED BY A SET OF LAWS THAT RELATE PRESSURE, VOLUME, TEMPERATURE, AND THE NUMBER OF MOLES OF GAS. THESE RELATIONSHIPS ARE INHERENTLY ALGEBRAIC AND REQUIRE STUDENTS TO BE ADEPT AT REARRANGING AND SOLVING EQUATIONS.

THE IDEAL GAS LAW ($PV = nRT$)

THE IDEAL GAS LAW, $PV = nRT$, IS A FUNDAMENTAL EQUATION IN CHEMISTRY. P IS PRESSURE, V IS VOLUME, n IS THE NUMBER OF MOLES, R IS THE IDEAL GAS CONSTANT, AND T IS TEMPERATURE. THIS SINGLE EQUATION ALLOWS FOR THE CALCULATION OF ANY ONE VARIABLE IF THE OTHER THREE ARE KNOWN. REARRANGING THIS EQUATION TO SOLVE FOR A DIFFERENT VARIABLE IS A CORE ALGEBRAIC SKILL. FOR EXAMPLE, TO FIND THE NUMBER OF MOLES (n), YOU WOULD REARRANGE IT TO $n = PV/RT$. ENSURING CONSISTENT UNITS FOR ALL VARIABLES IS CRITICAL FOR OBTAINING THE CORRECT NUMERICAL ANSWER.

COMBINED GAS LAW AND PARTIAL PRESSURES

THE COMBINED GAS LAW RELATES CHANGES IN PRESSURE, VOLUME, AND TEMPERATURE FOR A FIXED AMOUNT OF GAS. IT IS DERIVED FROM BOYLE'S LAW, CHARLES'S LAW, AND GAY-LUSSAC'S LAW, AND CAN BE EXPRESSED AS $(P_1 V_1)/T_1 = (P_2 V_2)/T_2$. SOLVING FOR ANY OF THE SIX VARIABLES IN THIS EQUATION REQUIRES ALGEBRAIC MANIPULATION. DALTON'S LAW OF PARTIAL PRESSURES, WHICH STATES THAT THE TOTAL PRESSURE OF A MIXTURE OF GASES IS THE SUM OF THE PARTIAL PRESSURES OF EACH INDIVIDUAL GAS, ALSO INVOLVES ALGEBRAIC ADDITION AND CAN BE USED IN CONJUNCTION WITH THE IDEAL GAS LAW TO SOLVE COMPLEX GAS MIXTURE PROBLEMS.

ACID-BASE CHEMISTRY AND pH CALCULATIONS

ACID-BASE CHEMISTRY IS A CENTRAL TOPIC IN GENERAL CHEMISTRY, AND IT HEAVILY RELIES ON ALGEBRAIC CONCEPTS, PARTICULARLY LOGARITHMS AND INVERSE RELATIONSHIPS.

THE pH AND pOH SCALES

AS PREVIOUSLY MENTIONED, THE pH SCALE IS DEFINED AS $\text{pH} = -\log[\text{H}^+]$. THIS RELATIONSHIP REQUIRES STUDENTS TO UNDERSTAND HOW TO USE LOGARITHMS TO CONVERT BETWEEN CONCENTRATION AND pH VALUES. FOR EXAMPLE, IF A SOLUTION HAS A $[\text{H}^+]$ OF 1.0×10^{-3} M, CALCULATING THE pH INVOLVES EVALUATING $-\log(1.0 \times 10^{-3})$, WHICH ALGEBRAICALLY SIMPLIFIES TO 3. CONVERSELY, IF THE pH IS 4.5, FINDING THE $[\text{H}^+]$ INVOLVES CALCULATING $10^{-4.5}$, AN EXPONENTIAL OPERATION.

ACID DISSOCIATION CONSTANT (K_A) AND BASE DISSOCIATION CONSTANT (K_B)

THE STRENGTH OF WEAK ACIDS AND BASES IS QUANTIFIED BY THEIR DISSOCIATION CONSTANTS, K_A AND K_B , RESPECTIVELY. THESE CONSTANTS ARE DERIVED FROM EQUILIBRIUM EXPRESSIONS THAT INVOLVE THE CONCENTRATIONS OF REACTANTS AND PRODUCTS RAISED TO STOICHIOMETRIC POWERS. FOR EXAMPLE, FOR A WEAK ACID HA DISSOCIATING IN WATER: $HA + H_2O \rightleftharpoons H_3O^+ + A^-$, THE K_A EXPRESSION IS $K_A = ([H_3O^+][A^-])/[HA]$. SOLVING FOR K_A , OR FOR THE CONCENTRATION OF SPECIES WHEN K_A IS KNOWN, OFTEN INVOLVES SETTING UP AND SOLVING QUADRATIC EQUATIONS, A MORE ADVANCED ALGEBRAIC TOPIC.

TITRATION CALCULATIONS

TITRATION IS A COMMON LABORATORY TECHNIQUE USED TO DETERMINE THE CONCENTRATION OF AN UNKNOWN SOLUTION BY REACTING IT WITH A SOLUTION OF KNOWN CONCENTRATION. THE CALCULATIONS INVOLVED IN TITRATIONS OFTEN REQUIRE STOICHIOMETRIC CONVERSIONS, MOLAR CALCULATIONS, AND THE USE OF THE ACID-BASE EQUILIBRIUM PRINCIPLES DESCRIBED ABOVE. DETERMINING THE EQUIVALENCE POINT, WHERE THE MOLES OF ACID EQUAL THE MOLES OF BASE, IS A FUNDAMENTAL ALGEBRAIC CALCULATION.

ORGANIC CHEMISTRY NOMENCLATURE AND RELATIONSHIPS

WHILE ORGANIC CHEMISTRY IS OFTEN PERCEIVED AS MEMORIZATION-INTENSIVE, ALGEBRAIC THINKING UNDERPINS ITS SYSTEMATIC NOMENCLATURE AND THE UNDERSTANDING OF STRUCTURAL RELATIONSHIPS.

SYSTEMATIC NOMENCLATURE (IUPAC)

THE IUPAC NOMENCLATURE SYSTEM FOR ORGANIC COMPOUNDS IS A SYSTEMATIC AND LOGICAL APPROACH TO NAMING MOLECULES. WHILE IT INVOLVES MEMORIZING PREFIXES, SUFFIXES, AND ROOT NAMES, THE UNDERLYING PRINCIPLE IS A HIERARCHICAL CLASSIFICATION BASED ON THE CARBON SKELETON AND FUNCTIONAL GROUPS. UNDERSTANDING HOW THESE COMPONENTS ARE COMBINED TO FORM A NAME CAN BE VIEWED AS A FORM OF ALGEBRAIC SUBSTITUTION, WHERE DIFFERENT FUNCTIONAL GROUPS OR SUBSTITUENTS ARE ADDED TO A BASE STRUCTURE, AND THE NAME REFLECTS THESE ADDITIONS IN A CONSISTENT WAY.

PREDICTING REACTION PRODUCTS AND MECHANISMS

UNDERSTANDING REACTION MECHANISMS IN ORGANIC CHEMISTRY OFTEN INVOLVES TRACING THE MOVEMENT OF ELECTRONS. WHILE THIS IS A CONCEPTUAL PROCESS, PREDICTING THE OUTCOME OF REACTIONS AND THE STRUCTURE OF PRODUCTS RELIES ON RECOGNIZING PATTERNS AND APPLYING PRINCIPLES THAT CAN BE FORMALIZED. FOR INSTANCE, PREDICTING THE REGIOCHEMISTRY OR STEREOCHEMISTRY OF A REACTION MIGHT INVOLVE CONSIDERING MULTIPLE POSSIBLE PATHWAYS AND SELECTING THE MOST ENERGETICALLY FAVORABLE ONE, A PROCESS THAT CAN BE MATHEMATICALLY MODELED. FURTHERMORE, UNDERSTANDING HOW FUNCTIONAL GROUPS INFLUENCE REACTIVITY CAN BE SEEN AS UNDERSTANDING HOW DIFFERENT "VARIABLES" (FUNCTIONAL GROUPS) AFFECT THE "OUTCOME" (REACTIVITY).

ADVANCED APPLICATIONS AND PROBLEM-SOLVING STRATEGIES

AS STUDENTS PROGRESS IN THEIR CHEMISTRY EDUCATION, THEY ENCOUNTER MORE COMPLEX PROBLEMS THAT DEMAND A HIGHER LEVEL OF ALGEBRAIC SOPHISTICATION. THESE OFTEN INVOLVE SYSTEMS OF EQUATIONS, GRAPHICAL ANALYSIS, AND THE APPLICATION OF CALCULUS-DERIVED CONCEPTS, EVEN IF THE CALCULUS ITSELF ISN'T EXPLICITLY REQUIRED.

SYSTEMS OF EQUATIONS

IN ADVANCED TOPICS LIKE CHEMICAL THERMODYNAMICS, PHYSICAL CHEMISTRY, OR COMPLEX REACTION NETWORK ANALYSIS, STUDENTS MAY NEED TO SOLVE SYSTEMS OF SIMULTANEOUS EQUATIONS. THIS COULD INVOLVE RELATING ENTHALPY, ENTROPY, AND GIBBS FREE ENERGY, OR DESCRIBING THE KINETICS OF MULTIPLE INTERACTING REACTIONS. THE ABILITY TO USE SUBSTITUTION OR ELIMINATION METHODS TO SOLVE FOR MULTIPLE UNKNOWN IS A DIRECT APPLICATION OF ADVANCED ALGEBRA.

GRAPHICAL ANALYSIS AND CURVE FITTING

EXPERIMENTAL DATA IN CHEMISTRY IS FREQUENTLY PRESENTED AND ANALYZED GRAPHICALLY. UNDERSTANDING HOW TO INTERPRET GRAPHS, DETERMINE SLOPES AND INTERCEPTS, AND USE LINEAR REGRESSION TO FIT DATA TO LINEAR MODELS IS CRUCIAL. BEYOND LINEAR FITS, STUDENTS MAY ENCOUNTER THE NEED TO FIT DATA TO POLYNOMIAL, EXPONENTIAL, OR LOGARITHMIC CURVES, WHICH REQUIRES AN UNDERSTANDING OF HOW THESE FUNCTIONS BEHAVE AND HOW TO USE SOFTWARE TOOLS TO FIND THE BEST-FIT PARAMETERS.

DIMENSIONAL ANALYSIS AND UNIT CONSISTENCY

WHILE INTRODUCED EARLY, THE MASTERY OF DIMENSIONAL ANALYSIS REMAINS A CRITICAL PROBLEM-SOLVING STRATEGY THROUGHOUT A CHEMISTRY CURRICULUM. IT IS A POWERFUL ALGEBRAIC TOOL THAT HELPS PREVENT ERRORS BY ENSURING THAT UNITS CANCEL CORRECTLY IN COMPLEX CALCULATIONS. THINKING OF UNITS AS ALGEBRAIC VARIABLES THAT CAN BE MULTIPLIED AND DIVIDED IS KEY TO SUCCESS HERE.
